# ROMIK SOFTWARE

24 Church Street, Slough, SL1 1PT. Telephone: Slough (STD0753) 71535

ROMIK  
PROMISE A  
MINIMUM OF ONE  
NEW GAME EVERY  
MONTH

**BRITAIN'S LEADING GAMES SOFTWARE HOUSE ARE PROUD TO ANNOUNCE OUR NEW RANGE OF EXCITING GAMES & OTHER SOFTWARE FOR THE VIC 20**

(GAMES FOR:- BBC, DRAGON, SPECTRUM & ATARI AVAILABLE SOON)

**ALL ACTION GAMES CARRY A FREE ENTRY TO NATIONWIDE COMPETITIONS WITH FANTASTIC PRIZES**

## MARTIAN RAIDER

FOR UNEXPANDED VIC 20

Skim as close as you dare to the surface of the planet, devastating the Martian cities, destroying ammunition dumps (gaining more time), shooting down the ground to air missiles and U.F.O.s, dodging or blasting the meteorites.

"A REAL ACTION SHOT OF THE GAME"

## AIR-SEA ATTACK

FOR EXPANDED VIC 20  
YOU CAN USE 3K, 8K OR 16K RAM

Can you pilot a modern jet fighter? Take off from your aircraft carrier and engage enemy aircraft in battle. Shoot them down and then drop your bombs on the enemy aircraft carrier. Watch out — the enemy fighter is trying to do the same! If he gets past your air defence you are left to defend your own carrier with sea-air missiles. You each have 3 jets.

"A REAL ACTION SHOT OF THE GAME"

## SHARK ATTACK

FOR UNEXPANDED VIC 20

You are in shark infested waters after being thrown overboard from a pirate ship. Your only protection being an atomic net which you trail behind you, trying to cover all the visible ocean and ensnare the sharks at the same time. Beware of stopping or covering your tracks for too long, if you do, then the sharks will escape and come after you. Watch out for the ever increasing deadly octopi (sometimes the sharks will eat part or all of one!).

"A REAL ACTION SHOT OF THE GAME"

**NEW NEW NEW NEW NEW NEW NEW NEW**

## SEA INVASION

FOR THE UNEXPANDED VIC 20

Fight off the attacking sea creatures for as long as you can. Shoot the whale for a surprise score. Watch out for the crabs, starfish, & octopi!!!!!!!!!!!!!!!!!!!!!!

## MIND TWISTERS

FOR UNEXPANDED VIC 20  
FOUR GAMES TO STRETCH YOUR BRAIN  
Blackjack, Decipher, Four Thought and Teaser are our computerised versions of very popular home games and will test your mental agility and skill for many a long hour.

**BLACKJACK:-**  
You start with £1,000, the objective being to break the bank, to do this you have to win (including your starting money) £20,000.  
**Instructions:** You have to score nearer (but not over) 21 than the computer does. The computer deals your first card, you then place your bet and hit the return key, the computer then deals your second card. If you want another card hit the "C" key, if not, hit the "S" key.  
**Points:** Ace = 1 or 11, Jack, Queen, King = 10.  
Scoring 21 points with 2 cards — you automatically win.  
Scoring 21 points or less with 5 cards — you automatically win.  
Draw — the computer wins.  
Your kitty is automatically adjusted win or lose. If you lose all your kitty — game over.

**DECIPHER:-**  
You have to guess what combination of colours the computer has selected — to enter a colour just hit the colour button on the computer, when you have entered your 5 choices of colour, the computer will display (A) Nothing at all = None right, (B) Black or White Squares or Both — For every black square you will have a correct colour in the correct position, for every white square you will have a correct colour in the wrong position. If you cannot find the complete combination, it will be displayed when you have had twelve attempts.

**FOUR THOUGHT:-**  
You have to make a line of four squares — horizontally, vertically or diagonally BEFORE the computer does, taking turns to take a square (squares can only be placed at the bottom of the grid, or on top of another square). Keys: Hit the number key of the column you want your square dropped in then hit the return key.

**TEASER:-**  
The aim of the game is to score "15" BEFORE the computer does, using any combination of 3 boxes. If you cannot score "15" then you must try and stop the computer from doing so and force a draw. Keys: Hit the number key of the box that you want (you can only select an empty box).

## MOONS OF JUPITER

FOR EXPANDED VIC 20, 3K, 8K OR 16K

You are the commander of a fleet of destroyers... Looking on from the safety of mother ship, you send in one destroyer at a time to blast a passage through the moons of Jupiter. Your destroyers have to dodge, and blast the "U.F.O.s"... Watch out for the 'Gologs', they can smash your destroyers, but you cannot harm them....

## MULTISOUND SYNTHESIZER

FOR THE UNEXPANDED VIC 20

The Vic Multisound Synthesiser is very flexible and can be played in more ways than can ever be explained here, to create music and special effects. For example, create any tune, up to 255 notes (after following appropriate instructions), then press "F1" or "F3", then key "9" and enjoy the added effect. Now hit "+", listen to the difference. For a surprise — hit "—". Now add a melody over the top — hit key "8" then "7" — now play a melody, or experiment. *Have fun!*

## SPACE ATTACK

FOR THE UNEXPANDED VIC 20

Space attack is a game of skill, you, as the pilot of an intergalactic battleship, have to fight your way through wave after wave of various alien space ships

Our games are available from all good home computer shops, including: all Laskys branches, Micro C, inside Currys at: Birmingham (233 1105), Leeds (446601), Luton (425079), Nottingham (412455), Southampton (29676), inside Bridgers at: Bristol (650501), New Malden (01-949 2091), and at: Leicester (546224), London (387 9275), Manchester (834 0144), Micro-C, Chromasonic Electronics, 48 Junction Road, Archway, London N19 5RD (01-263 9493/263 9495, Telex 22568), Maplin Electronic Supplies Ltd, P.O. ## Eye on Commodore: Interview by Henry Deckhand

**John Baxter is Marketing Manager of Commodore Business Machines. That makes him Vic Supremo for these isles. So we thought it was about time that the readers of Vic Computing should hear his views on life, art, the meaning of the universe — and the current position of the Vic, particularly in relation to the forthcoming 64 and Max.**

**Vic Computing:** How many Vics have you sold in total now?

**Baxter:** Effectively since 1 January 1982 we have sold 60,000. I would guess between 100,000 and 130,000 by the end of this year.

**Vic Computing:** What will happen then?

**Baxter:** Well, we are already trying to source more Vics from Germany or other locations to ensure enough stocks — there isn't a problem but we are just trying to prepare ourselves in case. At the moment sales are going extremely well and we are extremely pleased — we sold about 12,000 last month.

**Vic Computing:** Vic's quite unusual among home computers in that it has never had a major upgrade in its life. As far as I know the only major change in Vic has been the addition of things like extra peripherals and software and a change from one keyboard to another ...

**"Screen legibility was a major consideration in going for 22 characters..."**

**Baxter:** That's absolutely right. Commodore has quite a lot of experience in making micro-computers and it does help — so unlike many other people who launch a product with a lot of bugs we had virtually none. And that's why we've never had to change the product. There are some bugs in it, but they are very minor and only a very experienced programmer will find them.

**Vic Computing:** How have you been answering the single major criticism of the screen size?

**Baxter:** Well, there is already a large number of complaints

**"We will be making an offer to all Vic 20 owners whereby they can get a 64 at a special price..."**

coming in about 40 column machines. To be able to use a 40 column screen you have to sit within two or three feet of the television — further away you just can't see the characters. This was a major consideration in us going for 22 characters: you can be quite a long way from the TV and still use it. And there is some question of the radiation from TVs being harmful if you are right on top of it. At the moment we are trying to find out if there is any research on this — I'm not certain of all the details, but many other countries don't allow these radio emissions to come from the TV; they have to be shielded.

**Vic Computing:** What are the big sellers among the add-ons at the moment?

**Baxter:** Cassette decks are number one. A lot of people ask why we don't just do a general-purpose cassette interface, but I think everyone knows the problems of loading from all sorts of different cassette decks — and

the one thing we do get with ours although it may be slow it ain't half reliable. It loads virtually every time. And that's important: there is nothing more frustrating than finding you can't load programs.

**Vic Computing:** Are you selling a lot of paddles?

**Baxter:** Not a huge number. There is a limited number of games for which paddles are useful for paddles. Joysticks and keyboards seem to cover most applications.

**Vic Computing:** How about big-sellers on the software side?

**Baxter:** By far the largest sellers are *Introduction to Basic Parts I and II* — something we predicted would happen, and the reason why we spent so much time on them.

**Vic Computing:** How many Part Is have you sold?

**Baxter:** To date the worldwide total is about 200,000. And in the

UK alone I think we've sold about 30,000 to 40,000. That's a lot when you compare the number of Vics sold to date. Part II has been only going a little while but currently it's outselling Part I.

**Vic Computing:** And other products that you're selling?

**Baxter:** The Super Expander is probably selling the best among the programming tools, followed by the Programmer's Aid and then the Machine Code Monitor. The Super Expander has sold about 7,000 or 8,000 — which is fairly high, as you really have to understand Basic to use it effectively. Around 6,000 Programmer's Aids and 4,000 Machine Code Monitors have been bought ...

**"I would guess we will have sold between 100,000 and 130,000 Vics by the end of this year"**

**Vic Computing:** What else sells well?

**Baxter:** The games packs. Omega Race is a good example — only launched three months ago, and sales are excellent. It's an excellent game, too; it is one of the top arcade games in the States and we have an exclusive deal with Bally to produce it. The interesting thing is that once a program developed in Japan or wherever became a hit there, then took a year to get to the States and another year or so to reach the UK: but now we find we are able to convert so fast, mainly because many of them were written on 6502s anyway, so that as soon as it becomes a hit in the arcade we can get it out on the Vic within three months.

The products which are beginning to overtake the standard 'Invader' type games are Sargon Chess and the 'Adventure' series. They are 'mind' games, there's no graphics in them at all. I think this is because of the type of person who has bought a Vic — it is not just a computer for kids. Maybe the parents bought it originally for the child to play games or to learn programming. But now it's almost as much the mum and the dad who are using it.

In fact the traditional games just

## "We don't see the 64 replacing the Vic..."

aren't selling as well as we originally thought they would. Products like Mastermind, Quizz-master, Robert Carrier, Know Your Own IQ, the GCE revision programs — they are going extremely well. I don't think there was a game product on our top ten last month — the top one was Sargon Chess.

**Vic Computing:** Let's talk about the future products a bit. What's the delivery position on the 64?

**Baxter:** They will be at the dealers during November; we expect that by Christmas about 10,000 will have gone out.

**Vic Computing:** Where are they being made for the UK?

**Baxter:** Braunschweig in West Germany.

**Vic Computing:** And how is the 64 going to impact the Vic?

**Baxter:** I don't think it will. For one thing, unlike some of our competitors we are finding a large number of Vic owners will want to go on to our next product. We've found very few bugs in the 64, it works very well and it does exactly what we said it would do. It is more powerful than a lot of business computer systems on the market today; in fact, if it was an 80 column machine — which we will in fact be making — it would compete with a large number of existing business computers today.

It has a number of features that are unique and very advanced: the sound chip alone is absolutely phenomenal, there is nothing to touch it on the market today. We have several orders from people who say the music chip in there alone is, better than the synthesisers they have.

But we don't see the 64 replacing the Vic 20, for several reasons. One is that it is more than a 'personal' computer; it has 64K RAM, it has a number of advanced features, it will link to dual disk drives and daisywheel printers, it will have a Prestel link early next year... and it will be a really professional computer.

Commodore doesn't just produce one computer and say 'that's for everybody — it's suitable for business use and for home use and for everything else'. No computer can be everything to everyone; the requirements of a laboratory or a graphics units or word processing or games are all different.

We see the market as various different segments. The video-game computer will die out very quickly because with a micro-processor in there anyway you can give it a keyboard and make it into a real computer at the same price. For that market Commodore has the Max, which will be a superb 3D games-player with sound and graphics — but it also has a mini-Basic for programming. Price will be about £100. Then we have Vic 20 retailing at the moment between £150-£170.

And there's another product, as yet unannounced. And we have the Commodore 64 at the top end. That's our 'personal' range, before we get to the business products.

We try to make all our products upgradeable. So Max cartridges will fit the 64: the Vic printer and the disk drive will also work on the 64 — the disk will need one simple ROM change right now, and in the future we'll avoid even that. We are not trying to build in obsolescence into the machine.

The Vic is still selling extremely well and we expect to still be selling it even up to June next year. But at some stage we'll be bringing in a product to replace the Vic 20 — which certainly isn't the 64, because that's a much more powerful computer and is aimed at the top-end.

**Vic Computing:** So the product to replace the Vic 20 will use the same cartridges as the Max, the 64 and so on?

**Baxter:** Exactly. We are trying to create a full range which is

totally compatible. It would mean that a program written on the 64 will not work on the machines below it, because it would use the 64's extra features; and the same applies to the new product in the middle. Whereas a product written for the Max will work on any of the others.

Incidentally, the new 64 programs may use all 64K and are for complete home help — education, business, and so on. They will come on to the market I would guess at Spring next year; they are extremely complicated programs, very long and very factual, and we reckon it will take six or nine months to write them.

**Vic Computing:** There's no problem about running Vic programs on the 64?

**Baxter:** The Basic is the same but some of the locations are different, so if you use PEEKs and POKEs and so on you'll have problems because some of those locations have changed. But it wouldn't be hard to make a Vic program work on a 64 — if you want to: the power of the 64 is so much greater, and the facilities are so extensive. If you have a simple two-dimensional game it makes poor sense not to convert it to use the sprite graphics, the sound, the 3D capability of the machine.

**Vic Computing:** So will you be offering current Vic owners any incentive to change their machine?

**Baxter:** It is always difficult. We've already had complaints — which I think are unjustified — about the price having dropped since people bought their Vics. But this applies to TVs, home computers or even business computers. When we first launched the product we didn't know exactly how many we were going to sell. Of course the more you produce the cheaper the costs become because you start to recover all your R&D costs. So the

price can come down, and it's only right that it should.

But the trouble with saying 'in that case I shouldn't have bought it, I should have waited' is that you could be saying that for ever. There will *always* be a more powerful computer coming which is better value for money.

As for the question of replacing the Vic, we will be making an offer to all Vic 20 owners whereby they can get a 64 at a special price. We'll probably want them to return their Vic and we will send them a brand new machine. It will cost between £100 and £200 — the reason it's flexible at the moment is because we don't know what we are going to do with the Vics when they come back.

## "The upgrade offer will cost Vic owners a fraction of the price of a new 64..."

It's not easy to upgrade a Vic physically to a 64, because we have to make changes to the casing and it's not sensible to cut the plastic. And I can't guarantee a time either.

But there will be some kind of upgrade offer, and it will cost Vic owners a fraction of the price of a new 64. It's going to be done simply as a service to them — I think that we will be the first and probably the only company that will ever do that.

In other words anyone who buys a Vic today needn't worry. He or she won't find themselves disappointed that the product's out of date in nine months time and wishing that they'd waited for a 64.

**Vic Computing:** But you have no idea when you'll start doing this?

**Baxter:** Well, I'm sure you appreciate that to actually run something like that is a logistic nightmare. Because all the Vics will have to come back to us, and I'm going to have to work out a system by which we can actually do it. We don't expect the quantity involved to be that high, because most people buy a computer for what they can do today and most are quite happy with what they've got.

# Let Commodore expand your horizons.

VIC 20 is the finest home computer that money can buy.

And the better you get to know it, the more confident, adventurous and ambitious you'll become.

You'll want to take advantage of the vast range of VIC software: a superb and constantly-growing selection of programs, embracing business systems, entertainment, education and many applications in the home.

Every program in the series has been designed by experts, and chosen for its quality and value for money.

VIC business software covers a wide range of applications, including spread-sheet analysis, stock control, information handling and word-processing.

A mind-blowing range of games including Scott Adams' world-famous 'Adventure' series.

Advanced space games, including the sophisticated 'Omega Race'.

Learn subjects as diverse as English Language, programming, and biology.

And 'home' software ranges from IQ tests to Robert Carrier menus.

In addition, there is a range of VIC software, like programmers' aids and graphics packages—

to add to your understanding and enjoyment of computers and computing.

There's even a special 'VicSoft' Club for VIC 20 enthusiasts, with many advantages including special offers to club members.

PRICES RANGE FROM £4.99 to £24.95 INC. VAT

For more information, a catalogue of VIC software  
and details of your local retailers or dealers please phone or  
complete the coupon and send to:  
The Commodore Information Centre,  
675 Ajax Avenue, Slough, Berkshire SL1 4BG.  
Telephone: Slough (0753) 79292.

VCVCO 12/82

## 80 columns — and more

You just can't keep down those people at Stack Computer Services. The latest from their Vic enthusiasts is an exciting new cartridge for the VIC-20: "SUPERCHARGER PLUS offers all the tricks we've learnt for the Vic programming short-cuts, the easiest graphics around, saves time and labour".

SUPERCHARGER PLUS includes all of the graphics and 'toolkit' features of VICKIT 1 and VICKIT 3 plus the 3K extra RAM you need for graphics: it costs £49. The version of SUPERCHARGER without the 3K is £45.

80 columns from Stack...

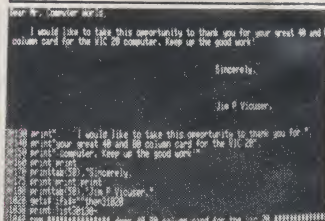

Even better is a new 40/80 Column board for the Vic. This gives you a 40-column display on a TV in monochrome, or 80 columns on a professional monitor — which means a clear display and double (or quadruple) the amount of data

displayed. The result is easier editing, at the very least: and word processing on 80 columns really is preferable.

"The Vic 20 can now be classed as a micro with facilities to compare with more expensive business micros", say Stack. £99.99 plus VAT is the price.

Stack is on 051-933 5511.

We've heard of another 40/80 column add-on: it comes from Computer World in Holland, something of a haven for Vic enthusiasts.

... and from Computer World.

The Computer World cartridge has a 40 or 80 column display (switchable from Basic without losing any program in memory). Vic graphics, upper and lower-case (with true descenders), full cursor control, and program editing in 40 or 80 column modes are all supported. It costs \$249 and Computer World is at Hilvertsweg 99, 1214 JB Hilversum, Netherlands.

## A better printer?

DRG Business Machines has a graphic printer for the Vic that offers a good deal of extra capability at a quite small increase in price over the 'official' Vic printer.

It also comes from the same manufacturer. A Japanese company called Seikosha makes the Vic-1515 printer, and it also sells more or less the same unit without a Vic interface as the Seikosha GP-80. DRG's unit is the next one up in the family, provided with the Vic connections and called the GP-100VC.

The specification looks like the 1515's — 80 characters a line, dot matrix action, 30 characters per second print speed. So what's so special about it? Well, in addition to the standard Vic alphanumerics and all the graphics symbols you get a fair-to-good graphics capability.

In fact at the price it's an excellent graphics capability. The GP-100VC lets you mix graphics, alphanumerics and double-width characters on the same line, too. And there's a single command to repeat graphics output if you want.

All in all a neat little unit — and priced well at around the £235 mark, depending on how much of a mark-up DRG's local dealer decides to take. Call 0934 416392 for your nearest dealer.

**Legal Dept:** Atari still has a court case scheduled against Commodore claiming infringement of copyright on the PacMan game, but that won't be heard until the middle of next year. Meanwhile round one has gone to the Commodore: Atari has withdrawn its motion for a temporary injunction to stop sales of Jelly Monsters. Why? Well, we think it's because a similar case in Hong Kong went against Atari recently: and HK precedents can apply over here.

**'Computers are Wonderful' Dept:** "A computer club enrolling 150 members within a week of launching, plus huge demands in the area for any information on home computers has convinced Sutton Libraries that the boom is here to stay" it says here. They are holding a Home Computer Fair in the Central Library, Sutton, on 20-22 January 1983. It's being supported by the Association of London Computer Clubs and there are no admission charges.

### Cheap colour plotter coming?

Buried in the vaults of Commodore Towers there's a good-looking printer/plotter that will probably be officially on sale in the new year. It will cost around £160, and we think that's amazing value — particularly as it's a colour plotter. Resolution is good but not great; but what do you expect at the price? It comes from a Japanese company called Alps, which also makes the 1540 disk for Commodore: it uses 6in-wide paper and four coloured biros. Yes please, Daddy.

**Oops:** Our 'correction' for a bug in the **Programmers Reference Guide** itself included a mistake. Try again: on page 89 line 20 in the bottom program should read **FOR L = 0 TO 7: FOR M = 0 TO 7.**

**Arfon back:** And now the good news — the Arfon expander board is back in production. Torch Computers, which builds a kind of business version of the BBC Micro, has acquired the now-defunct Arfon. 25 people have lost their jobs, but 15 are still there beavering away on the add-on.

**Clever chip:** Commodore is reportedly working on an extraordinary microprocessor chip called the 650000 (or 65000 — what's a zero or two between rumour-mongers?). It's a high-tech big-machine processor, an eight-bit device that manages to approach the performance of 32-bit processors by clever use of multiple eight-bit chips: and it would sell for \$6 to \$12 in quantity, which makes it really cheap for such things. Cheap enough for the Vic?

## Fixing Vic

Ever thought of the possibility of your Vic requiring attention or repair after your one year guarantee expires? Probably not, as the Vic is proving to be pretty reliable. But god's Law says that it won't last for ever; the cost of fixing computers can be pretty high, especially in relation to the Vic's quite modest purchase price.

Commodore has fixed up a deal with one of the leading insurance companies, Domestic & General, to organise a scheme that extends the full guarantee period to two years from date of purchase.

The scheme has apparently proved very popular. To get peace of mind and protection the premiums will cost you £20 for the Vic, £25 for the printer and £35 for the 1540 disk. Vicsoft members get a discount.

## VICSOFT — Commodore's mail-order club

Vicsoft is Commodore's mail-order club for Vic owners. When you registered your Vic guarantee with Commodore you became eligible for membership; in any case, all Vic owners who have returned their guarantee cards will receive the Vicsoft catalogue four times a year.

In addition to offering you products (from Commodore and some 'approved' independent suppliers) to use with your Vic, each issue contains hints, tips and information that should add to your understanding and enjoyment of the computer. The catalogue prices are not all discounted, but each issue does contain some special offers for Vicsoft members — and they may be enough to justify the £5 pa joining fee.

In any case, it's probably worth using the catalogue to buy the things in it — rather than shopping around for them from individual dealers. It's 'one-stop shopping', with a single form to fill in and postage included in the prices.

The Autumn issue, the First, is still out now. Future issues of the catalogue will contain special offers which include computer camps, competitions, training courses, visits to computer exhibitions — all at special members' prices. Vicsoft members will also be given the first opportunity to purchase many new Vic 20 products as they are introduced by Commodore.

If you haven't seen the catalogue, try calling Slough (0753) 73638 and ask for a copy.

# Joysticks

## Using Joysticks on the Vic by Chris Preston

One of the interesting features of the Vic is the possibility of adding a joystick for extra realism in 'simulation' games.

Without a joystick you have to rely on four standard keys in a diamond shape to move the cursor or some other object on the screen.

But it is all too easy to hit the wrong key in the heat of the moment and send your lunar lander crashing into the surface of the moon. How much easier it would be if you had a control stick just like that on an aircraft!

There are two possible kinds of joystick which can be added to a Vic. Both types plug into the game I/O port.

### Switch joysticks

The simpler (and cheaper) type of joystick consists of four switches, again arranged in a diamond shape:

Normally the joystick is in the central position and none of the switches are closed. If you push the stick away from you, switch 1 will close; if you move it to the right switch 3 will close.

Fancier versions will also have another advantage over the 'four keys' method in that if you push the stick forward and to the right at the same time, switches 0 and 3 will both close.

There is also a 'fire' button, for shooting down the dastardly invaders.

So how do we program this device? Well, inside the Vic there are two powerful I/O chips called VIAs (and numbered 6522 as the MOSD Technology part). Switches 0, 1, 2, and the fire button are connected to VIA 1, while switch 3 goes to VIA 2.

A VIA has (among other things) two 8-bit output registers, A and B. Each line in each register can be individually programmed to be an input or an output, by writing a value into another register called the Data Direction Register.

There are two of these, one for output register A and one for output register B. To set a particular line in say register A to be an output, we write a '1' bit to the corresponding bit in the data direction register; a '0' means that the corresponding bit in the output register will be an input.

Here is a table showing which bits in the two VIAs we are interested in:

Decimal	Hex	Function
37137	\$9111	Output Register A Bit 2—Switch 0 Bit 3—Switch 1 Bit 4—Switch 2 Bit 5—Fire Button
37139	\$9113	Data Direction Register A
37152	\$9120	Output Register B Bit 7—Switch 3
37154	\$9122	Data Direction Register B

To read the joystick, we need to set the corresponding bits in the two ports above to be inputs. Here a tiny little snag crops up. Port B on VIA 2 is used as a column select for the keyboard — which means that if we are using the joystick, the keyboard will be partly disabled (the keys which will not work are: 2 4 6 8 0 — and CLR/HOME). So the data direction registers should always be restored after you have finished with the joystick.

Here is a sample program showing the principles of how it works:

```
1000 POKE 37139,0 : POKE 27154,127 :  
      REM SET UP DDRs  
1010 A = PEEK (37137) : REM LOOK AT VIA  
1020 IF (A AND 4) THEN PRINT  
      "SWITCH 0"  
1030 IF (A AND 8) THEN PRINT  
      "SWITCH 1"  
1040 IF (A AND 16) THEN PRINT  
      "SWITCH 2"  
1050 IF (A AND 32) THEN PRINT  
      "FIRE BUTTON"  
1060 A = PEEK (37152) : REM LOOK  
      AT VIA 2  
1070 IF (A AND 128) THEN PRINT  
      "SWITCH 3"
```

This is OK for getting the feel of how the joystick operates, but what we want is a way of converting a program from the 'four keys' method to the joystick. It is obviously difficult to give a completely general solution as every program is written differently, but typically there will be a GET statement to test the keyboard followed by a number of IF statements to see if a key has been pressed. For instance:

```
1000 GET A$ : IF A$ = " " THEN 1000  
1010 IF A$ = "I" THEN 1100  
1020 IF A$ = "J" THEN 1200  
1030 IF A$ = "K" THEN 1300  
1040 IF A$ = "M" THEN 1400  
1050 IF A$ = " " THEN 1500 : REM FIRE  
1060 GOTO 1000
```

Well then, we can replace the GET statement by a subroutine which is called instead of the GET:

```
9000 POKE 37139,0 : POKE 37154,127 :  
      REM SET UP DDRs  
9010 J1 = PEEK(37137) : REM TEST VIA 1  
9020 J2 = PEEK(37152) : REM TEST VIA 2  
9030 JS = J1 or J2 : RETURN
```

then replace the tests on the value of A\$ with tests on the value of JS:

```
1000 GOSUB 9000  
1010 IF (JS AND 4) THEN 1100  
1020 IF (JS AND 16) THEN 1200  
1030 IF (JS AND 128) THEN 1300  
1040 IF (JS AND 8) THEN 1400  
1050 IF (JS AND 32) THEN 1500 :  
      REM FIRE  
1060 GOTO 1000
```

Next issue: potentiometer joysticks.

## FIND

by Tim Duncan

My offering this month is a short machine code version of the "FIND" utility, similar to that provided on Vickit and the Programmers' Aid cartridge. This routine is most useful when writing and debugging programs.

When you type in the listing below and RUN it (don't forget to SAVE it first!) The program will poke a machine code routine into a safe area of memory (\$02A1-\$02FF) where it will stay until you switch off the machine. You can load other programs without affecting the routine.

To find a particular bit of Basic code or a particular string of characters in your program, all you have to do is write the expression you want found as the first line of your program; then type SYS 673 (RETURN). The routine will print out the line numbers of every line which contains that expression. If your first line was 'A = ', the routine would find lines such as A = 3 or A = A + 1, but would also find BA = 5 since this also contains "A = ".

To understand how the routine works, Suffice it to say that each line is stored in the following format:

LO	HI	LO	HI		Ø
----	----	----	----	--	---

Link Address      Line Number      Basic Statements      End of Line

The link address points to the address where the next line starts. The link address and the line number take up two bytes each, so the Basic statements start with the fifth byte. We know when we have reached the end of the line when we find a zero byte, and we can find the beginning of the next line by using the link address.

```

10 DATA 165,43,133,0,165,44,133,1,160,3,200
20 DATA 177,0,205,***,240,26,201,0,208,244
30 DATA 160,0,177,0,133,2,200,177,0,133,1
40 DATA 165,2,133,0,5,1,201,0,208,221,96
50 DATA 132,2,162,0,232,200,189,***,201,0
60 DATA 240,6,209,0,240,243,208,16,160,2
70 DATA 177,0,170,200,177,0,32,205,221,169
80 DATA 32,32,210,255,164,2,184,80,182,234
90 PRINT"JW LOADING MACHINE CODE W"
100 M=PEEK(43)+256*PEEK(44)+4:HI=INT(M/256):LO=M-256*HI
110 FOR L=673 TO 757
120 READ B#
130 IF B#="***" THEN POKE L,LO:L=L+1:POKE L,HI:GOTO 150
140 POKE L,VAL(B#)
150 NEXT L
160 LIST 10-80

```

Now let's see how the routine works. The first thing is to find where the program starts. This depends on how much memory you have added to your Vic, so we look at locations 43 and 44 to find out. Skipping the link address and line number, each byte of the line is compared in turn to the first byte of the expression in line 1. Since we know it's the first line of the program, the expression must start at the start of memory plus four bytes.

We continue comparing bytes until we find one that matches or until we come to the end of the line. If they match we must compare the next byte with the second byte of the expression — and so on. If they fail to match we go back to where we were and continue looking for a match with the first byte. If we reach the end of the expression we know we have found it, and print the line number.

When the routine finds the end of the line, it uses the link address to get the next line. A link address of zero means we have found the end of the program.

## COMING SOON

● **Tinymon on the Vic** — Richard Hunt's helpful implementation of Butterfield's monitor. Next issue, hopefully.

● **Programmers' Aids reviewed** — three packages from Commodore, Stack and Audiogenic.

● **Machine Code Monitors reviewed** — HESBAL, Dr Watson and Commodore's own MCM.

● **Games reviewed** — JD Collins gives his next 'punter's progress' page over to star-rated reviews.

● **Type 'n Talk** — review of speech input and voice output devices: win one in a brand new competition: a program for the blind.

● **Word processing on the Vic** — at last we've completed our review of all the WP packages we can find.

● **Beginners colour** — a run-down on Vic colour basics from Chris Preston.

● **RTTY and the Vic** — radio ham Mike Todd looks at the possibilities.

● **Beginning Assembler** — start of a major multi-part series.

● **The Complete Advanced Graphics** — amazing series from an extraordinarily young reader.

● **Turning Turtle** — the wonderful 'Turtle Controller' language: a Vic version this month, build your own Turtle to follow.

● **Structured programming** — what is it? Why should you bother? More Good Programming hints from Chris Preston.

# Fifty outstanding programs for the VIC 20!

This is a totally revised edition of the best-selling program book 'Symphony for a Melancholy Computer' by Tim Hartnell.

There are now more than 50 programs (double the number in the first edition) and all programs fit the unexpanded VIC 20.

## This incredible book includes:

**SYMPHONY FOR A MELANCHOLY COMPUTER – 50 OUTSTANDING PROGRAMS FOR YOUR VIC 20, is just £6.95.**

**INTERFACE, Dept. VC, 44-46 Earls Court Road, London, W8 6EJ**

Please send me ( ) Symphony for a Melancholy Computer – £6.95  
 ( ) ZAP! POW! BOOM! Arcade Games for the VIC 20 – £7.95  
 ( ) Getting Acquainted with Your VIC 20 – £6.95

I enclose £ \_\_\_\_\_

Name \_\_\_\_\_

Address \_\_\_\_\_

# VICPRINTER

for £79.90 inc VAT

(Also fits most PET computers)

Put a ZX-PRINTER  
 (Order from Sinclair Research,  
 Freepost, Camberley,  
 GU15 3BR, cost £59.90 inc VAT)  
 on your VIC/PET using

**SOFTX PRINTERFACE**  
 costing only ... £19.95 + £1 p&p

- ★★ Very High resolution graphics (higher than VIC)
- ★★ Full VIC/PET character set + user defined graphic characters
- ★★ 42 column printer with superb formatting facilities
- ★★ Operating commands same as the VIC printer
- ★★ Simple to use! No extras required

Send orders/enquiries (state computer model) to:  
**SOFTX COMPUTERS**  
 37 Wheaton Road, Bournemouth, BH7 6LH  
 Telephone 0202 422028

# VIC 20 DOES THE POOLS

**Win on the Pools with the help of this great package. The cassette contains three files:**

**CLUB FILE** — holds the names of the first and second division football clubs  
**FORECAST** — does the forecasts for you  
**RESULT** — type in the results each week and hold the records

— Plus a comprehensive instruction manual which tells you exactly what to do.

**All this at a recommended price of only £12.00 (this includes cassette, manual, VAT and P&P).**

So send now to:

**DAMISO**  
 PO BOX 743 2450 COPENHAGEN SV  
 DENMARK

# V i c t u a l s

## Flyover

This one comes from A Millett of Softex, who has a vested interest in the form of the listing — it comes from the £50 Sinclair ZX printer via the interface that his company sells (end of sales plug: see the ad in this issue for more info!). The game itself is long and traditional, but it's a pretty good hi-res action game.

The ZX printer uses silver-coated paper and works electrostatically,

which means in effect that the print head removes the silver to reveal the black underneath when it wants to create a character.

As for the listing, we had to reduce the original photographically to fit on the page; but here's a sample of the true size and actual width:

## A Punter's Progress: Episode Three

by J D Collins

Hello Comrades. I want to start by correcting a couple of comments I made in my last epistle. I speak of the games ROX from DK'tronics, Vic Gammon from Bug Byte and Space Storm from Rabbit Software.

I finally cracked the colour problem in **ROX** and got it to play on a light purple background: and all was revealed! It's not the most thrilling game action-wise but it was fairly challenging.

I also learned how to play Vic Gammon and heartily recommend it — but more about that later.

My congratulations to Rabbit Software on **Space Storm**; I had a really pleasant chat with one of their staff on the phone about the loading problem, he was most helpful and sent me a loadable program by return of post. Space Storm is the best thing I've seen so far; at first I thought the graphics were good but the pace a bit slow — then it speeded up on me and Pow! Excellente!

If you are starting out in computing from the ground up like me, but have not got a Vic 20 yet, maybe I can offer a preliminary word. When you buy your Vic get at least one games program to keep your spirits up (not withstanding my comments on program quality). And get the Commodore joystick too — it is useful, cheap and robust, and it works! I'd also advise you to take a vow of abstinence on your social life and work through the Commodore **Introduction to BASIC Part 1** before doing anything else. I wish I had.

Lastly, if you can, do it with a friend. Then you will have both a shoulder to cry on and someone to share your triumphs. I feel really good when I get the hang of

something and want to say "look what I've done!"

Oh, and don't forget to take out a subscription to **Vic Computing**; the programs alone will be worth it and all that TechnoBabble will make sense eventually. Then you too can show off at parties!

I am still working through the **Introduction to BASIC** in between entering more games programs from various magazines. I may not become a proper programmer; but it is surprisingly satisfying to have entered a program and got it working, maybe adding a few extra bits like easier instructions, a change of sound effect, a simple flashing "you crashed" message somewhere else.

One odd thing: I keep having trouble with programs that have DATA statements in them. Somehow my Vic reads one less data item than is listed. Yes, I checked that the number of data items corresponds to the number of items to be read. The only answer I have come up with so far is to add a zero data item to the end of the last line of data items. Anyone got any idea where I am going wrong?

Another problem I would like to solve is the One Armed Bandit program in **Vic Computing** April 82. The 'HOLD' option only works on the third box, and the third box also has part of its frame missing. I have pored over the listing for hours: but as I don't understand the details of the program, nor the overall structure I cannot see where the fault lies. I would also like to add tumbling dice and jackpot sound effects but cannot work out how to do it even with my extra 3K memory. I suspect that to add sound I would have to

juggle with those mysterious memory locations that I don't understand as yet. Shame about that, it is quite a good game otherwise.

I have recently had my Vic 'touch-tested' by family and friends, and it was interesting to see how they got on. My brother, sister-in-law and nine-year-old nephew Andrew came to stay recently and I thought it would be a good chance to see how Andrew got on with a Micro-Computer. At first I had to load and run all the games for him and help out with the controls. I think it was his first sight of a keyboard, especially one that was not his, but that did not last long.

I think I made it all more complicated than it need have been by teaching Andrew to load programs by name instead of just the simple LOAD command, there being only one game per tape; but the keyboard practice probably came in useful later on. By mid-week Andrew had enough skill to load, run and reload programs on his own, only calling for help when the 3K memory expansion had to be added or removed. By that time my brother had muscled in on the act and Andrew was faced with competition!

My sister in law was not at all interested. I wondered if this was all part of the boys versus girls thing we have in our culture, but that is a can of worms I won't open up here.

Two things struck me about Andrew's handling of the Vic. First he had a lot of trouble remembering to use the Return key; maybe Andrew just needed time to settle down with the thing. Or maybe it should have a new name like 'Command' or something.

# DROP IN ON ALL THE BITS AND PIECES FOR YOUR VIC 20

## THE ORATOR

A VIC 20 SPEECH SYNTHESISER WITH 64 WORD  
VOCABULARY PLUGS INTO USER PORT

**£49.95**

FOR USE WITH

HANGMAN	£7.00
MATHMAN	£7.00
ALPHAMAN	£7.00
SPELLMAN	£7.00

## VIC MUSIC SYSTEM

- ★ PROVIDES A MEANS OF DEFINING AND PLAYING  
MUSIC USING THE THREE 'VOICES OF VIC'
- ★ FULL SCREEN MENUS, FOR MUSIC DEFINITION,  
AND MACHINE CODED ROUTINES TO CONTROL  
MUSIC PLAYING
- ★ VARIOUS DEMONSTRATION MUSIC PIECES
- ★ NEEDS 16K MEMORY EXPANSION

**£15.00**

## TO HELP YOUR VIC GROW UP

### MEMORY EXPANSION

VIC 3K RAM	£23.00
VIC 8K RAM	£35.00
VIC 16K RAM	£56.00
PROGRAMMERS AID	£27.00
SUPER EXPANDER HI RES	£27.00
MACHINE CODE MONITOR	£27.00

### EXPANSION BOARDS

STACK 4 SLOT EXPANSION (INCLUDES EXTRA 3K)	£41.00
ARFON 7 SLOT EXPANSION (INCLUDES SEPARATE POWER SUPPLY AND LID)	£80.00

## HARDWARE

VIC 20	135.00
CBM 64	279.00

## WORD PROCESSING

AUDIOGENIC WORDCRAFT 20  
INCLUDES EXTRA 8K OF RAM WHICH  
CAN BE USED FOR OTHER PROGRAMS.  
FULL COMPATIBILITY WITH VIC 1515  
PRINTER, PARALLEL AND RS232C  
PRINTERS WORKS ON DISK OR  
CASSETTE

**ONLY £105.00**

# Extending the Arfon Expander

by Chris Durham

The Arfon expansion unit is a popular method of plugging up to seven cartridges into the Vic simultaneously. Unfortunately there is no way to switch off any unwanted cartridges. And 'clashing' cartridges, two or more which use the same area of memory, cannot be plugged in at the same time: this means a lot of cartridge changing with resultant wear on the connectors.

Also, because of the change of memory locations, programs written for the unexpanded Vic will not run when more than an extra 3K RAM is plugged in.

The following modification allows all seven sockets to be used by any combination of cartridges, selection being made by a small switch bank at the rear of the expansion unit PCB. Total cost of the modification is about £3 and the job takes approximately 45 minutes.

The theory is quite simple. If you remove the +5v power from a cartridge it ceases to exist as far as the operating system of the Vic is concerned. By switching the power connection to each socket individually you can make the Vic see only those cartridges you have selected.

## The Actual Work

Before carrying out the modification ensure that the mains plug is removed from the socket. Start by removing the Vic from the expansion unit and then undo the six bolts holding the PCB in place, making sure that you do not lose the nuts and locking washers beneath the unit. Turn the board over and find the main +5v supply line on the printed circuit (see fig. 1). Decide how many sockets you wish to be able to switch out (six are shown in the diagrams here) and cut the printed circuits where indicated, using a sharp modelling knife. The supply line for socket No. 1 is situated on the top of the PCB as shown in fig. 2. To ensure a good break make two cuts approximately 1mm apart and remove the copper in between.

Cut the veroboard to size and mount on the underside of the PCB as follows: drill two 3mm holes approximately 5mm apart and 7mm from the edge as shown in fig. 2. Make up some five-minute epoxy resin glue and coat the top half of the veroboard as indicated in fig. 3A. Fix the veroboard to the underside of the PCB ensuring a good 'key' through the two holes. Make sure that the glue does not spread too far along the copper strips underneath the veroboard or block any holes outside the glued area.

After the veroboard is firmly glued, solder the wire connections between the veroboard and the pins as shown in fig. 3B. Use single-core wire and route cables neatly along the board, sticking down with a small spot of superglue. When soldering the wire to the pins, ensure a good physical connection by wrapping the wire around the pin before applying the soldering iron. Where the wire joins the veroboard from underneath, fit the wires as shown in fig. 3C to ensure a good connection.

When all the wires are connected, fit the wire links across the veroboard (fig. 3A) together with the connection to the 5v power supply (red cable on the PCB). Now fit the switch bank onto the veroboard and solder the pins. Alternatively, a socket can be soldered to the veroboard and the switch bank can be mounted on the socket. If you use the latter method then ensure that you firmly support the veroboard from underneath when you fit the switch into the socket.

## Testing

If you have a test-meter you should now check that with all switches in the 'off' position there is no connection between the pins marked A-F and the 5v power supply cable. Then test that a connection exists for each socket when the relevant switch is moved to the 'on' position.

Once you are satisfied that the wiring is correct and that there are no solder 'bridges' between tracks, re-mount the PCB with the six bolts: remember to replace the plastic spacers and the locking washers.

Finally, refit the Vic — you may have to adjust the position of the PCB slightly to ensure a correct fit. Once the Vic is installed, turn on the power and ensure that the Vic functions correctly. Turn the power off again and fit all your cartridges. Select either a games cartridge or a particular combination of memory and switch on. The Vic should respond as if only the selected cartridges are plugged in. If you have left any sockets permanently connected then these should only be used for cartridges such as the Machine Code Monitor or the Programmers' Aid, which require a SYS command to activate them, on the IEEE 488 interface.

Tel: 01-863-0833

## RABBIT BASE

Your own personal Database Management System for your VIC-20. Ideal for any storage and retrieval of any type of record. Powerful search, sort and calculation features.

RETAIL PRICE £14.99

## RABBIT WRITER

The wordprocessor for your VIC-20. This program requires 16K RAM Expansion. 'Rabbit Writer' enables the rapid and easy creation of text and its printing to the printer. 'Rabbit Writer' has powerful editing and right hand justification and has many other Word-processing features via the appropriate function keys such as indenting, centering, etc. and enables expanded characters to be printed. It also has the facility to merge i.e. names and addresses from Rabbit Base.

RETAIL PRICE £19.99

NOW ITS HERE !!

## FROGGER

Bring the famous pub game home. First cross the motorway without getting run over and then home across logs and turtles. But beware of snakes crocodiles and submerging turtles. Incredible multi-colour mode graphics written in machine code.

RETAIL PRICE £9.99

## SPACE STORM

Amazing 3D Graphics of the popular asteroid game. Superb value for money. One of Rabbits best-selling games.

RETAIL PRICE £6.99

Super Worm £4.99  
Night Flight £4.99  
Charpet 20 £4.99

Rabbit Functions £4.99  
Ski-Run £4.99  
Dune Buggy £4.99

Cosmic Battle £4.99  
Rabbit Chase £4.99  
Code Breaker £4.99

## An introduction to user-defined graphics by Trevor Pitts

It is possible to have characters of your own design accessible via the keyboard on the Vic 20. This means you can have alien spaceships or little men running around the screen at your command.

First, some explanation of the character ROM. The 4K character generator ROM resides between locations 32768 and 36863 and is split as follows:

32768-33791... upper case and graphics  
33792-34815... reverse upper case and graphics  
34816-35839... upper and lower case  
35840-36863... reverse upper and lower case

Control Register No 6 (location 36869) normally points to the lower 2K of the character generator ROM; but by pressing the shift and Commodore logo keys together, lower-case characters are displayed. All that has happened is that Control Register No 6 has increased in value pointing 2K further up in memory. The value held in Control Register No 6 has moved from 240 to 242.

The character generator, or any part of it, can be moved into RAM at any of locations 4096, 5120, 6144 and 7168.

**By moving the character generator user-definable characters can be added to it.**

Your first task must therefore be to set aside enough RAM to store the character generator. If we wish to have the lower 2K character generator in RAM, we must allocate 2K of RAM in which to store it. On the unexpanded Vic the user Basic is between locations 4096 and 7679; so to save 2K of RAM using the start locations shown above, the only available start address is 5120.

By starting the character generator at this address, then, there is the 2K required — but we will take the second 1K for our user-defined characters. It will be necessary to prevent the character generator from being overwritten, so the top-of-memory pointers must be altered.

One major problem is that by taking 2.5K of the available 3.5K of user RAM you will only leave

1K for your program, which isn't much. There are ways around this, however, and I will expand on that later.

### First Steps

Each character is made up of 8x8 matrix — an example of the standard keyboard character A is shown in figure 1.

For your own characters, you must first have a design. The easiest way to do this is to draw the shape on paper with an 8x8 grid on it (see figure 1 again). The numbers across the top of the matrix in figure 2 are what concern us, and they run from right to left in normal binary numbering — that is, the first number is 1 and each successive number is double that of the last up to 128. In figure 2 I have shown a "space invader" character with the eight number totals that make up this shape.

Figure 1

Once you have designed your character you take the eight horizontal lines separately and add the values above each of the filled squares to give a total for that line. If the square is empty, ignore the value at the top of it. Start a new total when you have finished each line. You should end up with eight line totals for each character. (If a line has no filled-in squares, its total is zero and this must be included as one of your eight totals).

These totals are then put into a DATA statement, as in this program to move the character generator to RAM and include the user defined-character in figure 2:

```
10 POKE 51,255: POKE 52,19:
   POKE 55,255: POKE 56,19
20 FOR I=0 TO 1023
```

```
30 POKE 5120+I,
   PEEK(32768+I): NEXT
40 FOR I=0 TO 1023: READ A
50 IF A=999 THEN 500
60 POKE 6144+I, A: NEXT
70 DATA
   24,60,102,231,255,36,66,36
80 DATA 999
500 POKE 36869,253
```

Line 10 moves the top of memory pointers and the string pointers.

Lines 20-30 move the lower 2K of the character ROM into RAM starting at location 5120.

Lines 40-60 read the DATA statements and POKEs each into locations 6144 on; these statements contain your characters (in this case, only one character).

Line 50 allows you to jump out of the loop when all the characters have been read, therefore allowing you to add more characters when you like without altering the program.

Line 80 is a dummy DATA statement to mark the end of the user-defined character data: its value is used in Line 50.

Line 500 moves the character generator pointer (Control Register No 6) to point to location 5120.

When this program is run you can use all the characters on the keyboard as usual — except that the Reverse On characters are not now available. Now when you press the Reverse On key and then type @ the 'space invader' will appear. Similarly if you want to POKE this character to the screen, you must use the POKE value of Reverse On @ (which is 128).

Remember that you must either

poke a colour into the colour RAM or change the screen colour from white; otherwise the POKED character will be invisible.

### More memory

So now you have your own characters, but with only 1K left for your programs. The program we have just used allows for 128 user-defined characters, and incidentally wastes 0.5K of RAM inbetween the end of the character generator and the start of screen RAM at location 7680; but do you need 128 new characters?

In most games you will never need

POKE Val	Char	POKE Val	Char	POKE Val	Char
0	@	22	V	44	'
1	A	23	W	45	-
2	B	24	X	46	.
3	C	25	Y	47	/
4	D	26	Z	48	0
5	E	27	[	49	1
6	F	28	\	50	2
7	G	29	]	51	3
8	H	30	^	52	4
9	I	31	_	53	5
10	J	32	space	54	6
11	K	33	`	55	7
12	L	34	~	56	8
13	M	35	#	57	9
14	N	36	\$	58	:
15	O	37	%	59	;
16	P	38	&	60	<
17	Q	39	'	61	=
18	R	40	(	62	>
19	S	41	)	63	?
20	T	42	*		
21	U	43	+		

Figure 3

that many. So by making the following alterations to the program we can get 64 user-defined characters and leave 2K

Figure 2

of RAM free for user programs:

1. Alter Line 10 to POKE 51,255: POKE 52,27: POKE 55,255: POKE 56,23
2. Alter Line 30 to POKE 6144 + I, PEEK(32768 + I): NEXT
3. Alter Line 40 to FOR I = 0 TO 511: READ A
4. Alter Line 60 to POKE 7168 + I, A
5. Alter Line 500 to POKE 36869,254

The same rules for printing and poking the characters apply as before.

It is also possible to move the character generator a further 1K up in RAM. There are only 512 bytes available here, though, so this means we can have no more than 64 characters in total. If you look at figure 3 you will see that this will allow you all of the upper-case letters and all of the numbers plus various punctuation characters (POKE values 0-63): in fact all that we have lost are the block graphics.

In many games, very few characters are required — perhaps five or six different aliens, a starship, and asterisks and full stops as asteroids. We could therefore put our newly-defined characters in the character generator to replace any that we do not want — for instance, =, +, ., %.

To do this the following alterations to our main program are necessary:

1. Alter Line 10 to POKE 51,255: POKE 52,27: POKE 55,255: POKE 56,27
2. Alter Line 20 to FOR I = 0 TO 511
3. Alter Line 30 to POKE 7168 + I(PEEK 32768 + I): NEXT
4. Alter Line 40 to FOR I 0 TO 7: READ A
5. Alter Line 50 to POKE 7168 + I + (n\*8),A: NEXT
6. Delete Line 60
7. Alter Line 500 to POKE 36869,255

... Where n in line 50 is the poke value of the character that you

are replacing. So if you replace the equals sign with the 'space invader', line 50 would read:

POKE 7168 + I + (61\*8),A: NEXT

You should be able to find enough 'spare' characters from those shown in figure 3 to replace them with quite a few of your own. Each character can be put in separately, as above: but if you find a whole block of them that

you wish to replace (poke values 33 to 41, for instance), just change line 40 to read:

FOR I = 0 TO (m\*8-1)

...where m is the number of characters you are replacing. Using our example of the characters 33 to 41 inclusive, Line 40 would become:

FOR I = 0 TO (9\*8-1): READ A

But remember you must have nine DATA statements each consisting of eight figures, one DATA statement for each character.

## Carry on keying

There are many variations on this theme that you can try. Perhaps you may require normal and Reverse On characters but not block graphics in your character generator. To do this just load into RAM the parts of the ROM generator you require. Try this:

1. Alter Line 20 to FOR I = 0 TO 511
2. Alter Line 30 to POKE 5120 + I, PEEK(32768 + I): NEXT
3. Add a new line 34: FOR I = 0 TO 511
4. Add a new line 36: POKE 5632 + I, PEEK(33792 + I): NEXT

You will find that you now have ordinary upper-case letters, or Reverse On upper-case letters with the shift key pressed.

So try a little experimenting: games really come to life when you use your own characters.

# A NEW ERA OF WORD PROCESSING

The introduction of Wordcraft 20 for the VIC brings the benefits and advantages of full scale word processing directly to the general public. Until now only the business world could afford word processing systems but this amazing price breakthrough makes it available to everyone. Wordcraft 20 comes on a cartridge ready to plug into the back of the VIC. Included in the cartridge is an extra 8K of RAM that is also available for use with other programs – so not only do you get a word processor but you also get a memory expansion thrown in. The system also comes with complete documentation catering both for the inexperienced user and for those already familiar with Wordcraft 80.

Just look at these features:

- ★ Full use of colour and sound.
- ★ Full compatibility with VIC 1515 printer, parallel printers or RS232C serial printers.
- ★ Full control over margins, document width, tab

stops, decimal tabs, justified output, multiple copies. Complete control of the final output.

- ★ Automatic underlining and boldening.
- ★ Full screen display with automatic paging.
- ★ Full storage and retrieval facilities from disk and tape.
- ★ Full compatibility with Wordcraft 80.
- ★ Name and address capabilities – including labels.
- ★ Full document merging facilities.

Wordcraft 20. The package that the VIC user has been waiting for. A word processor of proven quality at a low price.

For the first time ever, every home can have one.

**audiogenic LTD**

Wordcraft 20: £125.00 inc. VAT and p&p. Available from all VIC dealers or direct from Audiogenic Ltd. PO Box 88, Reading, Berks. Tel: 0724 586334.  
Wordcraft 20 is copyright P.L. Dowson 1982.

# Catalogue

## The compleat software catalogue — part Two

There's a lot of software for the Vic, so we've had to split this Catalogue alphabetically by name of supplier over two issues. Part One appeared in October.

Prices include VAT and p&p except where noted. Most of the programs are available from Vic dealers or by mail order, and most are cassettes that run on the unexpanded Vic. You can assume that's the case unless the text says it isn't. Some we have reviewed and/or bought, so in a few cases the descriptions also

include a comment from us. We are however preparing a fuller review with star rating of all the games and business packages we can get hold of.

Each entry here is coded by use into one or more categories, as follows:

- G games
- B business
- E education and school
- H home
- P programming tools

**Honeyfold Software**  
Standfast House  
Bath Place  
High Street  
Barnet  
Herts

**Complete Assembler Course:** Comprises a 200-page paperback containing a complete self-paced instruction course on the 6502 instruction set (book available separately at £10) and a cassette or disk with four programs — assembler for unexpanded Vic and for 3K expansion, a BIN/BCD/Hex tutor (shows the interrelationship between the binary, decimal and hex number bases, and also demonstrates operation of the 6502 carry flag), and a set of BIN/BCD/Hex exercises. Price for book and software is £15 on cassette, £17 for a disk. [P]

**TOTL TEXT:** Good-looking word processor. Price £16.95 [H]

**TOTL LABEL:** Mailing list and label print program. Price £14.95 [H]

**TOTL TIME:** Time use program — output in various formats organised by person, project or activity. Price £16.95 [B]

**Research Assistant:** Compile and organise information — with reference to it by keyword. Price £16.95 [H]

**Bouncing Games:** Four levels of skill for six ball games. Price £9.95 [G]

**Peter V Hunt**  
62 Copythorne Road  
Brixham

Devon TQ5 8PU

**Hangman:** The old favourite. Three programs on the tape each with 50 words. Mail order only. Price £4. [G]

**Beetle Drive:** Another standard — roll a dice to create the shape. Mail order only. Price £4. [G]

**Word Perfect:** A word test — you choose the nearest meaning to the word Vic gives you. Three programs on the tape each with 30

tests and 90 possible answers. Mail order only. Price £4. [G]

**Impact Software**  
70 Redford Avenue  
Edinburgh EH13 0BW  
**Games Pack:** Alien, Road Race, The Island, Pontoon. Sounds good at the price which includes P & P. Price £5 [G]

**Kayde Electronic Systems**

**The Conge**  
Great Yarmouth  
Norfolk NR30 1PJ  
Free catalogue available.  
**Kayde Valley:** "The ultimate in adventure games". Price £7.95 [G]  
**Othello:** Traditional Japanese board game. Price £7.95 [G]

**L&J Computers**  
192 Honeyput Lane  
Queensbury  
Stanmore  
Middlesex

**Stock Control:** Reviewed pretty favourably by us two issues ago. Handles 110 items with 8K expansion, 300 with 16K; gives total inventory value, stock list, and stock-low items. Price £28.75. [B]  
**Address Book:** Also reviewed. Handles 50 name-and-address records with 8K expansion, 130 with 16K; gives search, list, amend, and print options including labels. Price £28.75. [H]

**Leisurionics**  
64 Abingdon Street  
Blackpool  
Lancs FY1 1NH

All these need 8K expansion. Add 50p for P&P.

**Golden Baton:** Venture into a strange province of danger and evil magic to retrieve the stolen Baton of King Ferrenuil (who he?). Price £9.95 [G]

**Time Machine:** As a newspaper reporter you have been sent to the old house on the moors to investigate the eccentric Dr Potter. . . price £9.95 [G]

**Arrow of Death:** Find and destroy the source of the evil blight which

has befallen your homelands. Price £9.95 [G]

**Llamasoft**  
Lindon House  
The Green  
Tadley  
Basingstoke  
Hampshire

All these are mail-order only — add 50p to the total order for p&p.

**Graphics/Character Creator:** Define lots of your own shapes. Price £8. [P]

**Utility Program:** A useful-looking parcel of a limited editor for games graphics and Softkey, a way of assigning Basic commands to function keys. Price £6. [P]

**Breakout and Deflex:** One speaks for itself, we know nothing about the other game here. Price only £3.95 though. [G]

**Defenda:** Full-feature version of the 'invaders' arcade game. Needs 8K expansion. Price £10. [G]

**Ratman:** Zap the rats with your hammer as they fall from the sky and before they mutate. Needs 8K expansion. Price £8.95. [G]

**Blitzkrieg:** Originally 'Bomb Buenos Aires' — fly your Vulcan bomber past the flak and raze the city. Price £4.95. [G]

**Traxx:** Version of the arcade game 'Amidar' and with echoes of 'Pacman'. We've seen this one and it looks very good — fast, colourful, fun. Needs 8K expansion. Price £10. [G]

**Melbourne House**  
131 Trafalgar Road  
London SE10

Three cassettes containing some of the programs in Clifford Ramshaw's **Vic Innovative Computing** book.

**Vic Innovative Computing 1:** Seven ok games — 'dumper' is a neat one, so is 'nuclear attack'. Price £5.95 [G]

**Vic Innovative Computing 2:** Seven more games. Price £5.95 [G]

**Vic Innovative Computing 3:** Seven more games. Price £5.95 [G]

**Micro Computer Software**  
Unit D6

Pear Industrial Estate  
Stockport Road  
Lower Bredbury  
Stockport  
Cheshire SK6 2BP

**Rogue Elephant:** Version of 'Rhino' with six skill levels. Mail order only. Price £4.99. [G]

**Music Tutor:** Use cursor and function keys to enter a tune on the stave displayed. Mail order only. Price £7.99. [H]

**Music Tutor 2:** Extended version that requires 16K expansion. Mail order only. Price £8.99. [H]

**Bill Sowerbutts' Gardening Hints:** For houseplants (maybe others to follow). Needs 8K expansion. Mail order only. Price £4.99. [H]

**Diggles Wine Cellar:** Questions you and then suggests a wine for the occasion. Needs 16K expansion. Mail order only. Price £4.99. [H]

**Diggles Kitchen:** Three separate volumes of tried and tested recipes — worldwide cookery, European, and "everyday family meals". All need 16K expansion. Mail order only. Price £4.99 a piece, two for £9. [H]

**Micro Machines**  
64 Burgate  
Canterbury  
Kent CT1 2HJ

**Spellings:** Master tape allows you to create and score spelling tests of increasing difficulty. Mail order only. Price £5.50. [E]

**Maths Tester:** Five grades of kids' arithmetic tests. Mail order only. Price £5.50. [E]

**British Isles Geography:** Master tape keeps score, displays a map of Britain and asks questions about towns. Price £9.50. Follow-up data tapes (£3.39 each) add questions on counties and ports, industries and physical features, places of interest etc. Mail order only. [E]

**Space Hero:** Adventure game, needs 16K expansion. Mail order only. Price £9.95. [G]

**Quest:** Adventure game, needs 16K expansion. Mail order only. Price £9.95. [G]

**Microworld**  
40 Broadfield Barton  
Crawley  
Sussex RH11 9BA

Sorry but we have no further information on these. Mail order only. Add £2.50 p&p to total order if you're spending less than £100.

**Data Base:** price £19.95. [H]

**Inventory control:** price £19.95 [B]

**Mailing List:** price £19.95. [H]

**Invoicing:** price £19.95. [B]

**Sales Ledger:** price £19.95. [B]

**Purchase Ledger:** price £19.95. [B]

**Credit Sales:** price £19.95. [B]

**Cash Sales:** price £19.95. [B]

**Credit Purchases:** price £19.95 [B]

**Morris Associates**  
37 Catherines Road  
Baglan

**Port Talbot**  
West Glamorgan SA12 8AT

**Puckman:** Sound familiar? A gobble game with keyboard or joystick control. Mail order only. Price £6.50. [C]

**Dive Bomber:** Pilot your (damaged) plane, drop the bombs, clear the high buildings and land — and it gets more difficult as you go on. Mail order only. Price £4.95. [C]

**Space Travel:** Zap the space birds (?) and avoid the bombs — and when you've gone 3,000 km it gets more difficult. Mail order only. Price £4.95. [C]

**Scram:** Defend your bit of space against the invaders, avoid hitting the (moving) ground contours, by using keyboard or joystick. Mail order only. Price £4.95. [C]

**Balloon:** Use an air pump to blow a balloon through a gap in a wall full of sharp flints. Price £5.50. [C]

**Wheel of Fortune:** Gambling game that needs 3K expansion. Price £4.95. [C]

**Dice:** Explicitly named game. Price £5.50. [C]

**They're Off:** Horse-racing game. Price £5.50. [C]

**Cosmic Blaster:** Zap the aliens, avoid the missiles. Price £5.50. [C]

**Boxing:** You're Rocky, Vic is the champ. Price £4.95. [C]

**Alien Blaster:** Well, the um object is to er blast the ah aliens (we think). Price £5.50. [C]

**Moonlander:** Vic version of the classic game that juggles velocity, fuel and distance. Price £5.50. [C]

**Booby Trap:** Save injured buddies from minefield: "great fun", it says here. Price £5.50. [C]

**Surround:** Box the computer in before it does that to you. Price £5.50. [C]

**Mr Micro**  
PO Box 24  
Swinton  
Manchester M27 3AL

**Gold Rush:** Remember the bejewelled rabbit 'buried somewhere in Britain'? Here's one microcomputer equivalent. Real cash to the winner! Price £16. [C]

**Great Balloon Race:** Graphics game for keyboard or joystick. Price £16. [C]

**Mysterious Island:** Recommended multi-tape adventure game for keyboard or joystick — needs 16K expansion though. Price £16. [C]

**VIGIL:** A 'Video Interactive Games Interpreter Language' — in other words, a programming language with over 60 commands specifically devised for writing games. The tape includes nine sample games as well. We haven't tested it, but secondhand reports are good. Supports input from joystick, paddles, and lightpen as well as keyboard; needs at least 3K expansion. Price £25. [P]

**Graphvics:** Cassette alternative to plug-in graphics cartridges, a utility which adds 18 commands for hi-res multi-colour graphics (152x60 points). Supports input from joystick, paddles, and lightpen as well as keyboard; needs 3K expansion. Price £18.50. [P]

**Hi-Res and Multi-colour:** Slimmed-down version of Graphvics for unexpanded Vic — 104x152 points. Price £15.75. [P]

**Piper:** Music composer with sample programs. Price £18.50 [H]

**Muvic:** Converts Vic into a pretty full sound synthesiser — define waveform, ASDR envelope, etc. Price £15.75. [H]

**Vic Value No 1:** Keyboard or joystick control on four games programs — Helicopter Lander, Dragon, Alien Pilot, Hunter. Price £7.95. [C]

**Tiny Pilot:** easy-to-learn computer-aided-instruction language. Good for kids. Price about £18.50. [E]

**Budgeteer:** Plan your personal expenditure. Price about £18.50 [H]

**Tiny Basic:** You really want a cut-down version of Basic? Price about £18.50 [C]

**Joystick Painter:** Requires expansion (and a joystick) to 'draw' colours. Price about £15 [C]

**Super Expander Screen Dump:** Copies displays in various magnifications — sounds great. Obviously needs the Super Expander. Price about £15. [P]

**Rayflexion and Micromind:** One game involves firing out rays to find the atoms, the other is a variant of 'Mastermind'. Price £5.95. [C]

**Alphasquare and Switchback:** One is a pattern recognition game, the other is a 'switch and match' puzzle. Price £5.95. [C]

**Brainbox:** Four 'educational' programs — Blaster Maths, UK Quiz, Math Machine, Spell-a-gram. Price £5.95. [E]

**Star Stream and Snake Trap:** One game has you avoiding the stars to land, the other guides the snake into the pit. Price £5.95. [C]

**Upset Me Not and Vic Boxes:** One is described as "weird roulette game", the other is a classic two-player boxes game. Price £5.95 [C]

**Laseroids and Beserk:** 'Invaders' style arcade game plus a 'zap the robots' mission. Price £5.95. [C]

**Vichello and Subaqua:** A version of 'Othello' and an underwater game. Need 3K expansion. Price £5.95. [C]

**Rainbow Passage and Pot Shot:** First is a you-vs-Vic board game, second is a reaction game. Price £4.95. [C]

**Flyer:** Fast reaction game. Price £5.95. [C]

**Protect:** Prevent your base from being attacked by nasties. Price £5.95. [C]

**Flash:** Fast two-player game. Price £5.95. [C]

**Astro-command:** Protect your city from the aliens (again). Price £5.95. [C]

**Damsel:** Two to four players rescue the maiden. Yuk. Price £5.95. [C]

**Vic Trek:** Boldly go where several dozen other people have gone before. Price £5.95. [C]

**Jupiter Lander:** Spaceship lander game. Price £5.95. [C]

**Yahtzee:** "Computer classic game" says Mr Micro, somewhat unforgivingly. Price £5.95. [C]

**Mastervic:** 'Mastermind' style code game. Price £5.95. [C]

**Etch-a-Vic:** Clever if limited tool for drawing on the screen and saving the results. Recommended. Price £5.95. [C]

**Vic Nab:** Outrun the Vic's blob as it chases you around a maze. Price £5.95. [C]

**Nab Plus:** ...and again, with extras. Price £5.95. [C]

**Vico:** 'Simon' type sound sequence game. Price £5.95. [C]

**Vic-Tac-Toe:** Noughts and crosses. Price £5.95. [C]

**VLP:** Chase and catch numbers. Keyboard or joystick. Price £5.95. [C]

**Beast Catch:** Move walls, catch monsters. Keyboard or joystick. Price £5.95. [C]

**Breakaway and Breakout:** Classic arcade games. Price £5.95. [C]

**Metric Conversion:** Explicit title for both-ways conversion. Price £5.95. [C]

**Alphabet:** Letter teacher for kids. Price £5.95. [C]

**Multiply:** Kids tutor. Price £5.95. [E]

**Horse Division:** Correct results move the gee-gees. Price £5.95. [E]

**Addition:** Teaches basic sums. Price £5.95. [E]

**Maths Test:** Varied questions with scoring. Price £5.95. [E]

**Maths Invaders:** Answer before the nasties land. Price £5.95. [E]

**VGEN:** Define up to 64 of your own screen characters. Price £5.95. [P]

**Northern Ireland Computer Centre**

4 High Street  
Holywood

Northern Ireland

**Vicstock:** Inventory control for up to 100 stock lines; reports on current stock position and re-order requirements. Needs at least 16K expansion; tape or disk formats. Mail order only. Price varies between £60 and £88. [E]

**Opus Z Software**  
525-531 London Road  
Westcliff-on-Sea  
Essex

**Bugbasher:** Endless green meanies, rotating maze, five levels of play. Price £3.00. [C]

**Bomber Run:** Blast out the enemy defences and fighter planes to capture the base. Price £3.00. [C]

**Encounter:** crack the lights and music code to land the giant spaceship. Price £3.00. [C]

**Vicpendium 1:** Four games — invaders, hangman with numbers, Othello, Gorgon's Tomb (grab swag before serpent strikes). Price £4.20. [C]

**Pedro Computer Services**  
4 Cowcross Street  
London EC1

**Cyber Men:** Fast machine-code game scoring points by eliminating and/or dodging the androids. Mail order or from the retail shop. Price £7 plus £1.75 p&p. [C]

**Vic Defender:** Fast version of the arcade game — fly low, avoid missiles, zap the enemy ship. Mail order or from the retail shop. Price £7 plus £1.75 p&p. [C]

**Big Four:** Meteorites (blast your way out of the meteor shower), Minefield (try to keep with your fast-moving mine detector!), Hunter (zap sheep, avoid the holes), and Lander (moonlander game). Mail order or from the retail shop. Price £5 plus £1.75 p&p. [C]

**Star Trek:** Zip around the universe eliminating Klingons with plasma bolts and lasers. Needs at least 3K expansion. Mail order or from the retail shop. Price £5 plus £1.75 p&p. [C]

**Data Base:** Define up to seven fields per record. Needs 8K expansion. Mail order or from the retail shop. Price £7 plus £1.75 p&p. [E]

**Hi-res Character Generator:** Easy editing to create your own characters and shapes. Needs 8K expansion. Mail order or from the retail shop. Price £7 plus £1.75 p&p. [P]

**Tiny Pilot:** easy-to-learn computer-aided-instruction language. Good for kids. Price about £18.50 [E]

**Budgeteer:** Plan your personal expenditure. Price about £18.50 [H]

**Graphvics:** Hi-res (152x160 points) and multicolour (76x80) from 18 new commands. Price about £18.50. [P]

# MR MICRO

LTD.

## VIC 20 SOFTWARE

### NEW DEAL FOR AUTHORS

We have developed a new package deal for software authors which can mean ten to one hundred times the earnings obtainable elsewhere for successful contributors to our long list of software titles. If you have a good program send it to us for IMMEDIATE RESPONSE. Our detailed booklet "MR MICRO & SOFTWARE AUTHORS" will accompany all replies. The booklet covers our agreement, sales policy, marketing, support, equipment loan schemes, special project commission, future plans and outlines the access your software will have to markets throughout Great Britain and the World.

### MR MICRO APPOINTED

**SPECTRUM DEALER** You should have noticed by now that the SPECTRUM COMPUTER GROUP offers a great range of equipment. At attractive prices. We are pleased to announce that from November 1982 we will be offering our customers *all* of the products listed in the Spectrum ads as well as our own extensive list of software. If you are in the Manchester area come to see us at our shop in SWINTON. We're just off the M61, M62, M63 or East Lancs Road, and will be open until 7.30pm every Thursday and Friday.

### NEW PRODUCTS AVAILABLE

**NOW** You may be familiar with some of the many tune playing programs available for the VIC but we now offer something which takes the VIC to new musical and sound heights. The VIC SOUND LANGUAGE or V.S.L. gives full control over the sound envelope it's attack, sustain, decay and volume. In fact V.S.L. converts the VIC into a sound synthesiser. Once loaded the new fully tokenised command can be incorporated into other programs to make sound effects, effective and music, musical. The package includes versions for any expanded VIC, sample performances and instruction manual. V.S.L. is only £10.95 inc VAT & P&P.

### EVER WISHED THERE WAS AN EASY WAY TO PRODUCE MACHINE CODE?

Your wish is now granted because we are now able to supply the "ABACUS COMPILER". This nifty software turns a subset of VIC basic into machine code quickly and easily. The compiler comes with a full instruction booklet and works with any expanded VIC 20. **INTRODUCTORY PRICE: £17.95 inc VAT & P&P.**

Please make cheques payable to: MR MICRO LTD. and send to **MR MICRO LTD., 69, PARTINGTON LANE, SWINTON, GTR. MANCHESTER M27 3AL.**

**ACCESS & BARCLAYCARD ORDERS tel 061 728 2282.**

or send a large s.a.e. for our latest lists.

**Hires/Multicolour:** Slimmed-down version. Price about £15. [P]

**Vigil:** Write-your-own-games language. Price about £25. [P]

**Piper:** Music composer. Price about £18.50. [H]

**Tiny Basic:** You really want a cut-down version of Basic? Price about £18.50. [C]

**Joystick Painter:** Requires expansion (and a joystick) to 'draw' colours. Price about £15 [C]

**Super Expander Screen Dump:** Copies displays in various magnifications — sounds great. Obviously needs the Super Expander. Price about £15. [P]

**Personal Computer Palace**  
4-6 Castle Street  
Reading  
Berks

Add 50p P&P per order.

**Headbanger:** Grab cash, avoid raining hammers, embrace revivifying aspirin. Sounds great! Price £9.95. [C]

**Rox:** Blast incoming boulders. Price £5.95. [C]

**3D Maze:** Price £4.95. [C]

**Pixel Productions**  
39 Ripley Gardens  
London SW14 8HF

The first six of these require 16K expansion, the rest are for unexpanded Vic. Mail order only

**Subspace Striker:** Most Pixel tapes are sci-fi games, all make excellent use of graphics (low-res, but the cleverest low-res we've seen) and sound: they also go in for a lot of detail — much background narrative, much artistry in the display (especially on spaceships). This game, like most of them, is recognisable: you bounce out of subspace to zap the enemy ships and get back before they retaliate. But it's still good. Price £9.50. [C]

**Trader:** A long one, maybe a bit too long. Your spaceship is looking for a colonisable planet; en route you find lots with mineral wealth on which you can stake claims. Avoid the hazards, though — black holes, supernovae, aliens, meteorite storms. Price: £9.50. [C]

**Encounter:** Aliens suck you into their UFO and probe your intelligence. If you fail, you get thrown out with the garbage. Recommended. Price £9.50. [C]

**Zor:** Battle the nasty robot medieval-style for control of earth. Price £9.50. [C]

**Demo:** A £3.95 trailer giving a taste of all the above, though it contains no playable games itself. If returned in good condition you get £2 off any one game. [C]

**Brainstorm:** Get three explorers and their Psion guides (intellectual snobs, and telepathic to boot — they figure in Trader too) across a lake of glup. Hi-res graphics on an unexpanded Vic. Price £4.50. [C]

**Harvester:** Up to four players reap rewards in the Boosterspace fields on the planet Delta. (What's Boosterspace? A narcotic "with

unpredictable side effects", again featured in Tsader. Mine's a pint, please.) Hi-res graphics. Price £4.50. [C]

**Guitar Pix 1:** First of a guitar tutor series. Price £4.50. [H]

**Vic Pix:** Generate your own video paintings "in the style of modern artists". Needs Super Expander. Price £4.50. [C]

## SUBSPACE STRIKER

IT COMES FROM NOWHERE AND TURNS BACK INTO THE DEATH WITH YOUR DEATH TORPEDOES, HAVOC IN THE SPACE

## PI

**PR Software**  
28 The Fairway  
South Ruislip  
Middlesex

**PRC1 — Six programs:** War, Smashout, Blackjack, Logic, Pick-up, Alarm Clock. Mail order only. Price £7.50. [C]

**Fly Snatcher:** you live in a field of bushes, and you have to eat all the flies (blah!) before the weasel gets you. If you survive you'll get more flies and a faster weasel next time. Clever, fast, reasonable graphics. Mail order only. Price £7.50. [C]

**Ant Raiders:** Looks easy but isn't — the ants shuffle around the screen, you try to wop them. Mail order only. Price £7.50. [C]

**Sub Attack and Missile Command:** Noisy and colourful games, one with you blasting ships and the other with you zonking mutants. Mail order only. Price £7.50. [C]

**John Probert Studio**  
Wootton Hall  
Wootton Waven  
Warwickshire

**Busvic-1:** Six accounting programs

for the unexpanded Vic — sales, purchase, sales totals, purchase totals, bank account, and bank reconciliation. Price £16.95 [B]

**Busvic-2:** A wages system for businesses employing 2 to 200 people. Tax tables and insurance contributions are built in; weekly and monthly versions are on the tape. Price £16.95 [B]

**Rabbit Software**  
380 Station Road  
Harrow

Middlesex HA1 2DE

**Rabbit Calc:** Spreadsheet 'what-if' financial calculator with echoes of 'Visicalc'. Mail order only. Price £19.00. [B]

**Rabbit Base:** Multi-user data base program. Mail order only. Price £14.99. [B]

**Rabbit Writer:** A word processor with several good-looking extensions over the usual cassette-based WP packages. Can take a name-and-address file up by **Rabbit Base**. Filing program, reportedly good. Needs 16K expansion. Mail order only. Price £19.99. [B]

**Myriad:** Traverse the galaxies, defeat various nasties. Needs 3K expansion. Mail order only. Price £9.99. [C]

**Frogger:** Classic pub/arcade game — bring the frog home across motorways, logs, and turtles (which may submerge) while avoiding the crocs. Good graphics and machine-code speeds. Mail order only. Price £9.99. [C]

**Space Storm:** Good graphics on this version of 'Asteroids': recommended. Mail order only. Price £6.99. [C]

**Ski Run:** Giant slalom with three types of race and nine skill levels. Price £4.99. [C]

**Cosmic Battle:** Destroy enemy fighters with laser and photon torpedoes, fend off their attacks with your shields. Price £4.99 [C]

**Night Flight:** Try and land your 747 by following the instructions given. Be careful — your fuel's limited. Price £4.99 [C]

**Super Worm:** Rabbit's version of the arcade game "Surround". Try and outwit the Vic's worm by making it crash into your tail. Price £4.99. [C]

**Charset:** Design your own characters. Price £4.99. [P]

**Rabbit Functions:** Define all 16 function keys as Basic words to speed up programming. Price £4.99. [P]

**Romik Software**

24 Church Street  
Slough

Berkshire SL1 1PT

**Shark Attack:** Excellent machine-code game — you've been chucked overboard in shark-infested waters, and you have to ensnare them all in your net. Watch out for the giant jellyfish, too. Very difficult to get a high score! Price £9.99 [C]

**Multisound Synthesiser:** The best music-maker we've yet found for the Vic. Plays notes from the keyboard — but also chords; full ADSR enveloping and various 'voices'; built-in drum rhythms... and more. If you really want to hear what the Vic is capable of sound-wise, get this tape. Price £9.99 [H]

**Martian Raider:** Skim the planet's surface zapping cities, destroying ammunition dumps (gaining more time), shooting down the ground to air missiles and UFOs, dodging or blasting the meteorites. Price £9.99 [C]

**Air-Sea Attack:** Fly from your aircraft carrier, battle enemy planes, bomb the opposition's carrier and defend your own. Price £9.99 [C]

**Mind Twister:** Four puzzle games — Blackjack, Decipher (like Mastermind with colours), Four Thought (beat the computer at making squares), Teaser (add up numbers in boxes before Vic does). Price £9.99 [C]

**Moons of Jupiter:** Needs expansion. Price £9.99 [C]

**Space Attack:** Beat off aliens as you weave through space. Price £9.99 [C]

**David Shambrook**

3 Holford Road  
Wootton PO33 4NL

**Vic Games:** Grand National, Mission Zorc, Fruit Machine, Grand Prix, Tennis, Air Attack. Price £6.50 [C]

## HIGH QUALITY NEW PROGRAMS TO HELP YOUR CHILD LEARN

PFL is currently testing a new series of educational software and the first programs are now available for sale to run on Commodore and Sinclair micro computers. The software is specifically designed to provide controlled drill and practice in graded exercises for children aged 7-11 in the following subjects:

English  
Arithmetic  
Verbal Reasoning  
Reading & Spelling (with special consideration for remedial problems).

Each program has been especially designed by highly qualified, experienced educationalists and written by professional programmers. Trials have demonstrated that these programs really stimulate children's enthusiasm and do help them to realise their academic potential. They will be of great value to parents and teachers for normal, advanced and remedial training and also for those preparing children for common entrance examinations.

For further details please write to PFL at the address below, stating whether you are a parent or teacher, the type of computer available and in which subjects you are interested.

Programs For Learning, 4 Stanley Road,  
East Sheen, London SW14 7DZ. Tel. 01-878 6498.

## Start with BASIC on the Commodore VIC 20

by Don Monro  
illustrated by Bill Tidy

Put the full power of the VIC 20 at your fingertips with Don Monro's entertaining and informative guide, as recommended by VIC Computing magazine. £ 5.80 (inc. p.&p.).

Tape cassette with 48 programs to accompany the book. £ 6.50 (inc. p.&p.)

Send cheque or postal order to Tiny Publishing Company, P.O.  
Box 120, Haywards Heath, W. Sussex, RH16 2TG.

Please allow 28 days for delivery.

## Simons Magee Computers

13 York Street  
Twickenham  
Middlesex

**Vic Music:** Be a composer (if you have all of 16K expansion). Price £15.00. [H]

**Simple Software**  
15 Havelock Road  
Brighton  
Sussex

Nice people with lots of Pet goodies and now some for the Vic.

**Simply Write:** Brand new Vic word processor, needs 16K expansion. Our pre-production copy had some bugs, but since then we've heard nothing but praise for this modest but economical package. Price £40.25. [B]

**Simply Link:** Cable and programs to link Vic to Vic or Vic and Pet. Clever and simple: the price includes five feet of cable. Price £42.55 [P]

## The Software House

146 Oxford Street  
London W1

That's the mail order address (add 60p P&P for postage). Call 01-493 3420 for personal shopping.

**Vic Synth:** Needs 3K expansion to make your Vic into a music synthesiser. Not tested by us, though. Price £9.95 [H]

up-counters board game a bit like Backgammon; Panic Driver is a racing car game. Mail order only. Price £7.95. [C]

**Maze Muncher and Reversi:** Consume dots, ghosts and fruits (?) in a maze (sound familiar?); then try your hand at the 'Othello' variant. Mail order only. Price £7.95. [C]

**Skramble:** "Probably the best game available for the unexpanded Vic" says Terminal Software; well, it is indeed pretty good. You fly over a whole series of different terrains towards your base, destroying the enemy's rockets, helicopters and oilwells as you go. Lots of variety, reasonable graphics. Mail order and from some dealers. Price £7.95. [C]

## Tharstern

Knowlden House  
Manchester Road  
Barnoldswick  
Lancashire BB8 5HQ

**Picture Pro:** Draw a picture on screen, press INST to automatically generate a saveable program which will reproduce it. Needs at least 3K expansion. Mail order only. Price £9.20. [H]

**Super Fruiter:** Great name! It's a fruit machine game with hold, nudge, gamble and shuffles. Needs 8K expansion. Price £9.20. [C]

**Flip Disc:** Needs 8K expansion. Described as "a board game like Othello". Price £5.95 [C]

**Padded Cells:** Needs 3K expansion. 3D maze game. Price £4.95 [C]

**Marsh Hoppers:** "Arcade action". Price £4.95 [C]

**Pontoon Master:** Price £5.95 [C]

## Task Enterprises Computer Software

131 Gipton Wood Road  
Oakwood  
Leeds 8

**Jouer 1:** No French connection, as far as we can see. Four sound-and-colour games — Shaft, Simon 2.2, Space Breakout, Submarine Bomb. Price £4.00 [C]

## Terminal Software

28 Church Lane  
Prestwich  
Manchester M25 5AJ  
Line Up 4 and Panic Driver: Line Up is a beat-the-computer stack-

## Thorn EMI Video

Upper St Martins Lane  
London WC2H 9ED

High-quality fast-paced arcade-type games with good graphics and fine packaging from this offshoot of the giant concern. More coming soon. Cartridges only, and only available from dealers: Thorn EMI doesn't recommend retail prices, so these are our guesstimates.

**River Rescue:** Navigate tricky river to reach intrepid but lost explorers; one or two players, joystick or keyboard. Recommended. Price about £21. [C]

**Vic Music Composer:** Write your own tunes — up to 30 minutes' worth on an unexpanded Vic, a symphony of more than four hours with 16K expansion. Price about £21. [C]

## Titan Programs

83 Ashwood Road  
Rudloe  
Corsham  
Wiltshire SN13 0LG

**Games Tape One:** Six games. Price £5. [C]

**Lunar Maths:** Apollo to the moon and back via ten simple maths questions. Needs 3K expansion. Price £5. [E]

**Roadrunner:** Run the Roadrunner through "the space warp of vehicle molecular" (sic). Price £5. [C]

**Android Attack:** Here they come again, this time from Jupiter. Price £5. [C]

**Missile Panic:** "The most outstanding game yet for the Vic" according to Titan. Capture nasties, avoid missiles for £6. [C]

**Space Hopper:** Get your Space Frog through a crowded universe without being crushed (or worse). Fast, hi-res graphics. Price £5. [C]

**Star Wars II:** Space battles — get as many of them as possible in two minutes. Price £5 [C]

**Naval Attack:** Zap the convoy from your battle cruiser. Price £5. [C]

**Space Wars and Battlezone:** Two two-player action games. Price £5. [C]

**Vic Centre** [C]

154 Victoria Road  
London W3 6UL

Stocks lots of games, especially the 'official' Commodore products, as well as three of its own.

**Kestrel Note Writer:** Basic word processing. Needs at least 8K expansion. Price £8.95 [E]

**Kestrel Chequebook:** Personal accounts. Price £8.95 [H]

**Kestrel Addressbook:** Keep track of your contacts. Price £8.95 [H]

**Victory**  
12 Leahill Close  
Malvern

Worcestershire

Mail order only. Deduct a quid from your total order if you buy two, £2 if you buy three.

**Mortgage:** Calculates repayments, period, interest rate; plots a histogram of your outstanding balance year by year. Very depressing, but useful. Price £4.99. [H]

**Bank Balance:** Could be almost as gloomy and probably as useful — the Vic shows in and outgoings with new current balance. Price £4.99. [H]

**Spell:** Kids' spelling test. Price £3.99. [E]

**Secret Code:** The Vic codes or decodes a secret-message word or phrase according to your key. Price £3.99. [C]

**Maze:** Wander around, avoid the robot. Price £4.99. [C]

**Dodgem:** Avoid the kamikaze driver as you dodge from track to track. Sounds like the M4 on Friday evenings. Price £4.99. [C]

**Wedge**  
17 The Meadows  
Flackwell Heath  
Bucks HP10 9LX

**Donkey Cong:** Not unrelated to the arcade game 'Donkey Kong'. Price £7.49 [C]

## LATE ENTRIES

**Bytewise**  
8 Valentine Avenue  
Sholing  
Southampton SO2 8CR

**House of Horror:** With only one box of machines to light the way, can you find and steal the treasure from the unspeakable horrors that protect it? Ghosts, bats, floating skulls and zombies await you. Price £5.99 [C]

**Cobalt Computers**  
3 South View  
Bramshall  
Uttoxeter  
Staffs

**Tacman:** Gather ye ghouls while ye may. Price is for unexpanded Vic — 8K version is £6.95. Price £5.95 [C]

**Games Cassette 1:** Ten Pin, Music Maker, and others. Price £5.95 [C]

**Utilities Cassette 1:** User-defined graphics, miniature characters. Price £5.95 [C]

**Control Technology**  
39 Gloucester Road  
Gee Cross

Hyde  
Cheshire SK14 5JG

**Vicsoft 7:** Looks good value — seven sound-and-colour games. Avoid cars, run down octogenarians and dogs: stay alive in space: defend castle against boulder: a version of Breakout: squash: multi-colour Mastermind: and sound synthesis. Price £5.00 [C]

**Damiso**  
PO Box 743  
2450 Copenhagen SV  
Denmark

**Pools:** We haven't tested this, but it could make your fortune — only for Div I and II, though, oddly enough. You type in results every week and the program uses the accumulated data to make the forecast: we don't know on what basis it does that. Price £12.00. [H]

**Eastmead Computer Systems**  
Eastmead House  
Lyon Way  
Camberley  
Surrey GU16 5E2

**Home Doctor:** "A series of programs designed to educate and advise on a comprehensive range of medical topics whilst being FUN to use." The six cassettes series cover:

1. Basic Medicine
2. Mainly for Women
3. Mainly for Men
4. All About Children
5. How Healthy are you? A Home Screening Program
6. 101 Home Nursing Tips

Each contains an average of 18 individual programs and "every one is packed with advice and information listed by symptom or health topic". Price £7.20 per cassette. [H]

## GIVE YOUR VIC SOME PIXEL POWER!

**PIXEL POWER...** A powerful utility program that makes it very easy to create and use up to 255 user-definable characters on the 8K plus expanded VIC20. There are no clumsy double loads, Pixel Power is fully automatic and saves along with your own basic program plus an optional 400 bytes of machine code.

Features include, View Set Drawing Board, Create, Amend, Reverse, Sketch Pad, Revert and Save Set. You can change the entire upper case and graphics to Japanese or Greek if you wish, create Space Invader characters or do a video painting of the Mona Lisa.

Comes with comprehensive instruction booklet for £9.50 including post in the UK. See Pixel Power in action now in our 'Subspace Striker' and 'Trader' games, buy both of them and get it FREE!

**SUBSPACE STRIKER...** Our top selling big screen graphics game. Blast the Federation battlecraft with your deadly antimat torpedoes and drive back to the safety of subspace, quick! VIC 20 + 16K. £9.50.

**TRADER...** An epic 48K graphic adventure that has to be seen to be believed. On your rounds of the Moons of Meriden, you meet some very bizarre customers indeed, but will you live to tell the tale? Runs in 16K in three parts. £18.50 for disk or tape.

Send SAE for more details of these and other Pixel software.

## SIMPLY RIGHT FOR VIC!

A good word processor is perhaps the most useful program for any microcomputer. SIMPLY WRITE has established itself as an outstanding low-cost word processor for the PET/CBM. Now there is SIMPLY WRITE FOR VIC, with extras made possible by the VIC's own special features.

Full-screen edit. Scroll or page forward and back, go direct to start or end of text.

Use Vic, RS-232 or IEEE-488 printer.

Insert, delete, transfer, memorise, append blocks of text.

Format text on output — no sideways scrolling needed to read text on screen.

Margins, margin release, tabs, hyphens, centred headings

Mix graphics and text. Re-define keys. Send control characters.

Auto-address form letters. Join sections of text to print and page long reports automatically.

Fully suitable for report-writing, education and small-business needs. Easy to use, full manual.

Needs 16K RAM pack. More than 400 text lines in RAM. Remember, the memory is there for other major programs too, not like an expensive cartridge word processor.

**PRICE £35 + VAT (Tape) £40 + VAT (Disk)**

Both versions work with tape or disk. Disk has sample files and utilities. Send for full details. FREE MICROMAIL NEWSLETTER will keep you up to date on unusual VIC, PET/CBM items.

## VIC-20 & CBM-64 SOFTWARE

### VIC MACHINE LANGUAGE GUIDE .....£4.95

This manual is for VIC owners who wish to gain an understanding of the built-in machine language routines so that they can incorporate them into their own programs. Details are given of over 30 routines including input & output routines, clocks & timers, arithmetic functions.

### TINY BASIC COMPILER .....£17.25

Gain the speed advantage of a compiled language, or learn about the working of compilers. Subset of basic includes all floating point arithmetic routines. Needs 3k or 8k expander. 8k version produces commented listing.

### HIRES/MULTICOLOR GRAPHICS UTILITIES ..£11.50

For unexpanded VIC. Each utility adds 7 commands to BASIC to allow easy access to the built-in high resolution and multicolor plotting facilities. Includes sample programs and detailed manual.

### SUPER EXPANDER SCREEN DUMP .....£11.50

Copies the high resolution graphics screen directly on to the VIC 1515 printer at 1, 2 or 3x magnification.

### JOYSTICK PAINTER (3k or 8k expander) .....£11.50

Use your joystick to draw pictures in the multicolor graphics mode. Save picture to tape or disk.

### GRAPHVICS .....£17.25

### TINY PILOT .....£17.25

### BUDGETEER .....£17.25

### VIC GAMES from .....£4.95

### VIGIL .....£22.95

### PIPER .....£17.25

### I-CHING .....£20.75

### SYNTHY-64 .....£22.95

### DR. WATSON BOOK OF ASSEMBLY LANGUAGE + SOFTWARE .....£14.95

All prices inclusive. 10% discount on 2 or more products. Deduct 15% on orders over £30. Overseas orders add 10% postage. SAE for catalogue. Dealer enquiries welcome.

**ADAMSOFT** 18 Norwich Avenue, Rochdale,  
Lancs. OL11 5JZ

## Commodore's software

Commodore's own software range is now pretty wide, which is why we've separated it from the independently-supplied offerings. Most of the Vic dealers stock most of these: otherwise you can order them directly from the Vicsoft catalogue (call 0753 73638 for your copy).

### Business

**Simplicalc:** 'Electronic worksheet' for financial calculations, especially 'what if' projections. Not bad at all, though it lacks some of the facilities you'd find in more sophisticated (and more expensive) spreadsheet packages on more sophisticated (and more expensive) micros. Recommended if you don't expect too much — and certainly if it's your first try with one of these programs. Needs 16K expansion, though. Price £24.95 (disk) £19.95 (cassette).

**Vicwriter:** Surprisingly good word processor, with an unusually good manual. You can specify line widths from 20 to 80 characters (the text scrolls off to the left of the screen); lots of 'standard' WP facilities. Needs 8K expansion. Price £24.95 (disk) £19.95 (cassette).

**Vic Stock Control:** Stores details on over 700 items; automatic 'stock low' indication, stock valuations and retail value totals on request. Limited but quick and effective. Needs 8K. Price £19.95 (cassette only).

**Vic File:** Store up to 1,000 records, sort or search through them, do calculations automatically on specific items in them. Another good one, again with a good manual. Needs 16K — and a disk. Price £24.95.

### Programming

**Introduction to Basic Part 1:** Excellent intro — good manual plus cassettes for example programs. Highly recommended. Price £14.95.

**Introduction to Basic Part 2:** Follow-on to take you into more advanced Basic. Review not yet completed, but it looks good — same format: manual plus cassettes. Price £14.95.

**Super Expander:** Cartridge that adds 3K memory and eight useful single-word commands for graphics. Price £34.95, though.

**Programmer's Aid:** Cartridge that provides invaluable program-development functions. Price £34.95.

**Machine Code Monitor:** Get into 6502 assembler via 18 commands. Currently under review by us (and being compared with other options). Cartridge. Price £34.95.

### Games

**Sargon II:** Best-selling chess game with six levels of play. Cartridge only. Price £24.95.

**Adventureland:** Non-graphic mind-bending 'adventure' game — using specific English-like commands from the keyboard you go into the caverns to collect treasures and escape the dragons, bears, killer bees, and chiggers (sic). Can take ages to play; but can be totally addictive. Price £24.95.

**Pirate Cove:** Similar game that takes you from London to Treasure Island hunting treasure with the aid of magic and carpentry. Avoid inebriated pirates, parrots, bones and galleys. Cartridge only. Price £24.95.

**Mission Impossible:** And another — collect Security Passes etc to find your way around the nuclear power station before the time bomb blows. Cartridge only. Price £24.95.

**Voodoo Castle:** And another — save the Good Count with magic. Cartridge only. Price £24.95.

**The Count:** And another — this time the Count is your opponent. Cartridge only. Price £24.95.

**Avenger:** Ok version of 'Invaders'. Keyboard or joystick. Cartridge only. Price £19.95.

**Star Battle:** You'll recognise this one, too. Aliens appear en bloc, peel off and come down to zap you. Keyboard or joystick. Cartridge only. Price £19.95.

**Superslot:** Good fruit machine game. Keyboard or joystick. Cartridge only. Price £19.95.

**Jelly Monsters:** Excellent and addictive nephew of 'Pacman'. Keyboard or joystick. Cartridge only. Price £19.95.

**Alien:** Another old favourite — dig holes in maze to trap nasties before they bop you. Keyboard or joystick. Cartridge only. Price £19.95.

**Superlander:** Good 'moon lander' — very difficult to get to the third landing site. Cartridge only. Price £19.95.

**Rat Race:** Neat variation on standard arcade format — you're a mouse, you have to eat the ten cheeses and escape the maze before the rats get you. Cartridge only. Price £19.95.

**Road Race:** Grand prix stuff with gearstick and accelerator controls as well as steering. Recom-

mended. Cartridge only. Price £19.95.

**Mole Attack:** Bop the moles as they pop out — but you lose points if you hit the wrong end. Great fun, highly recommended. Cartridge only. Price £19.95.

**Omega Race:** Terrific! Deservedly a best-seller — sounds a bit ordinary and is obviously a derivative of 'asteroids' (limited graphics, you're just piloting your ship around a square universe and zapping the aliens) but it is fiendishly addictive. Anyone beat out best score (so far!) of 97,800? Highly recommended. Cartridge only. Price £24.95.

**Gorf:** Advanced alien-bashing with lots of variety per game. Cartridge only. Price £24.95.

**Blitz:** Tricky bomber game — flatten the city to make yourself a landing site. Cassette. Price £4.99.

**Hoppit:** Good version of 'frogger'. Price £4.99.

**Type-a-tune:** Simple but effective keyboard-as-piano cassette. Price £4.99.

**Strategic Advance:** Sub-chess board game of strategy — you play against Vic, try to capture its pieces before they get you. Requires 16K expansion. Price £4.99.

**Race:** Another simple but effective game — complete the motorbike course without hitting cars or kerb. Price £4.99.

## Education

**English Language:** Twin-cassette GCE/CSE revision material. Sounds useful and seems ok. Requires 8K expansion. Price £9.99.

**Biology:** Twin-cassette GCE/CSE revision material. Generally very good, said our resident biologist. Requires 8K expansion. Price £9.99.

**Mathematics 1:** GCE/CSE revision including arithmetic, algebra, geometry and trig. Mixes modern

and traditional maths: good handling of scoring and testing. Requires 8K expansion. Price £9.99.

**Mathematics 2:** Follow-on cassette, more based on traditional maths: gets really difficult, too! Requires 8K expansion. Price £9.99.

**Physics:** In our view the best of the GCE/CSE revision cassettes (textbook publishers Hodder & Stoughton provided the input). Two tapes, requires 8K expansion. Price £9.99.

**Chemistry:** Another GCE/CSE revision twin-cassette pack prepared by Hodder & Stoughton. Requires 8K expansion. Price £9.99.

## Home

**Quizmaster:** Create and run your own 40-question quizzes. Works well. Needs 8K expansion. Price £9.99.

**BBC Mastermind:** Follows the original format, even down to that irritating doomy theme music — one to four contestants, each gets two minutes on a specialist subject and two on general knowledge. Questions by the BBC's Boswell Taylor. Good fun and recommended... though the occasional spelling mistakes are irritating. Requires 8K expansion. Master tape £9.99, data tapes £1.99 each (four for general knowledge, five on specialist subjects, more to come).

**Know Your Own IQ:** Based on Hans Eysenck, of questionable scientific value, and highly biased towards spatial relationships. Still, it's fair entertainment. Price £9.99.

**Know Your Child's IQ:** Probably more valid as an indicator of type of intelligence rather than an objective assessment of general IQ. But it's well done — based on a respected book by two Institute of Psychiatry people, for kids aged 5 to 11. Needs 8K expansion. Price £9.99.

**Know Your Own Personality:** Eysenck again, and again of questionable scientific value: lots of fun, though the spelling lets it down. Recommended, even so: do it with your lover (as it were). Needs 8K expansion. Price £9.99.

**Robert Carrier Menu Planner:** Fair to good instructions for recipes, including a novel feature that lets Vic do all the meal planning and even guest selection for dinner parties. Needs 8K expansion. Price £9.99.

**Vic Road User:** Excellent Highway Code tester. Good graphics, ok humour. Recommended. Needs 8K expansion. Price £9.99.

# Three New Video Games from PCP For Young and Old Alike

**Theme:** Headbanger enjoys being hit on the head by hammers falling from the sky but collapses if hit by too many without an asprin hitting as well. At the same time Headbanger tries to grab money bags. A brick wall on the screen is gradually knocked down by the hammers as the player attempts to strike Headbanger and to reach the money bags.

**Action:** Points for head collisions and money bags, plus 'pain meter' for head-to-hammer or asprin-to-head collisions and for money bags stowed.

**Price:** £9.95 incl. V.A.T.

## Rox

**Theme:** Rocks fall from the sky and the player tries to blast them with missiles before they hit the ground.

**Action:** Scores are awarded for hits and 'secret bonuses'.

**Price:** £5.95 incl. V.A.T.

## 3D Maze

**Theme:** The player attempts to escape from the maze which is shown in perspective view.

**Action:** Ratings are scored for the time taken to find the exit from the maze.

**Price:** £4.95 incl. V.A.T.

● Dealer enquiries welcome.

## WE PROUDLY PRESENT, FOR THE VIC 20

### THE INTERNATIONALLY SUCCESSFUL MYSTERIOUS ADVENTURES

These superbly written, Machine Code Adventures have been enjoyed by TRS80-VIDEO GENIE owners in Britain for well over a year now and are currently taking the U.S. by storm. The Author has now implemented these absorbing programs on the COMMODORE VIC 20 FITTED WITH 8K RAM PACK.

#### ALL ADVENTURES IN THIS SERIES INCLUDE:

Split screen display, Ultra fast Machine code response, Save game to cassette feature, Simple two word command entry, approx. 70 Locations to visit, 30 Objects to manipulate, 20 or more "problems" to overcome.

#### ADVENTURES PRESENTLY AVAILABLE:

- 1) THE GOLDEN BATON — venture into a strange province of danger and evil magic to retrieve the stolen Baton of King Ferrenuil.
- 2) THE TIME MACHINE — As a newspaper reporter you have been sent to the old house on the moors to investigate the eccentric Dr. Potter...
- 3) ARROW OF DEATH (Part 1) — In the first part of this epic Adventure you must find and destroy the source of the evil blight which has befallen your homelands.

These are the first three of a series which could ultimately total more than 20 Adventures.

**WARNING! — Only supreme courage and low cunning can ensure eventual success on these dangerous missions.**

**SEND CHEQUE OR P.O. FOR JUST £9.95 INC. VAT + 50p POST & PACKING TO:**

## Vision on the 64 by Steve Beats

The Commodore 64 has a high resolution capability which produces a screen resolution of 320 by 200 pixels. For some obscure reason this fact is not even hinted at in the manual. So here is a routine to draw a high resolution shape on the screen with an explanation of how it is done.

**Lines 10-40:** Sets up the video chip and puts the screen into bit map mode for hi-res plotting. The screen now starts at 24576 instead of 1024.

**Lines 50-60:** Clears the hi-res screen and sets the associated colour RAM to white. If you watch the screen being cleared you will see how the RAM is organised.

**Lines 70-100:** This is a kludged function to produce a pretty little pattern on the screen. The x and y

co-ordinates in the range 0-320 by 0-200 are sent as integers to the plot routine at line 2000. (You can replace this with any function of your own, of course.)

**Lines 2000-2030:** This is the main plotting routine which converts the x and y co-ordinates into an actual address on the screen and then sets one of the eight bits in that address according to its position.

This routine is quite slow, but it does give a good demonstration of the capabilities of the 64 when in high resolution mode. Of course, when the extra Basic cartridge becomes available graphics routines like this will be shortened and speeded up quite dramatically: and even the absolute beginner should be able to produce some quite impressive displays.

The following is a small basic program that shows just how easy it is to draw a couple of sprites and get them moving on the screen.

**Lines 20-30:** These lines set one variable to the start of the video chip, another to the address where the video chip looks for its printer to each block of sprite data.

**Line 30:** This line tells the video chip that the sprite data can be found in the 13th block of 64 bytes in memory (ie.  $13 \times 64 = 832$ ) which is where the sprite data starts.

**Line 40:** This is the 'sprite enable' register. It is only a single byte; therefore, to enable each sprite you must set the corresponding binary bit. In this case we require sprites 0 and 1 to be enabled, which means that we want the binary number 00000011 in the enable register.

**Line 50:** Register 29 is used to expand the sprites in the x direction. In the same way as the

enable register, each bit set expands the corresponding sprite. In this program only sprite 1 is expanded.

**Line 80:** There are the locations used to change the screen and border colours. They can hold a number from 0 to 15.

**Lines 90-110:** these just set the x and y co-ordinates of the 2 sprites in order to move them across the screen.

**Lines 200-240:** Each sprite requires 63 bytes of data for it be drawn. To design your own sprite you should draw a grid 24 by 21 and fill in each square corresponding to a dot on the sprite. When you have finished you start at the top left and turn each group of eight squares or dots into a binary number, putting a 1 every time you find a dot and 0 if there is no dot. You should then convert these binary numbers into decimal and put them into DATA statements as in this program.

## Programs from magazine listings

by Mike Todd

### VIC REVEALED, revealed

Regular readers will know that I'm no fan of *Vic Revealed* with its large number of errors and its atrocious presentation. To help those who bought a copy of the first edition, I produced a list of errata for the Vic user section of ICPUG (The Independent Commodore Products User Group). If you would like a copy, please send a stamped (20½p for 2nd class) and addressed envelope (at least 6x9ins) together with £11.00 (to cover costs) to me, c/o Vic Computing. It has 17 A4 pages and contains details of over 450 corrections or additions to the book.

The same author is reported to have produced another book, this time on *Vic Graphics*; and if it's anything like *Vic Revealed* I would recommend that anyone contemplating buying a copy wait until its worth is proven. We may be lucky and find a useful and well put-together book.

### To buy or not to buy

One question I am asked a great deal is "Should I buy a Vic 20 or wait for the Commodore 64?" It's a difficult question to answer.

The Vic 20 is now well established and falling in price; it has much software available and is a useful machine. The 64 is twice the price, but at least there is no need to buy additional RAM.

My own feeling would be to buy a Vic — especially if you want one for Christmas as the 64 is not likely to be widely available until the new year. If you find that it is too restricting; or if you want the extra memory, the more sophisticated graphics and sound, the ability to add a Z80

processor and the 40 characters per line; then Commodore should be offering an upgrade to the 64 for significantly less than the cost of a new one. (See the 'Eye on Commodore' interview — Editor).

If you go for this option, be warned that some software written for the Vic will not transfer to the 64. It is true that some could be converted, but it requires a good working knowledge of both machines. Most hardware, however, such as the printer, joysticks, light pens and the disk drive, will work on the 64 — although the disk drive will require a chip (ROM) to be changed.

### More bugs

In the last *Lore* there is a typing error in the short program in the fourth column. There should be a semicolon at the end of line 120. Omitting it makes the display a little difficult to read!

On page 12, I refer to the ability to mark a file as being the last on the tape. What actually happens is that a special END-OF-TAPE marker is written as soon as you CLOSE the last file on the tape. In fact you can also do the same when you SAVE a program to tape by using the format SAVE "PROGNAME", 1,2 (where the 1 designates the cassette and the 2 indicates, just like with OPEN, that this is the last on the tape).

If you've tried this, you'll have noticed that the error message produced is not "FILE NOT FOUND" (although it should be!) but a "DEVICE NOT PRESENT" error. This is due to a bug in the Vic and there's not a lot that can be done about it.

### Programs from magazines

The advantage of a Vic over a dedicated games computer is the ability to get games (and other software) in the form of cartridges, cassette tapes and floppy disks all from a variety of sources and at prices ranging from under a fiver to over a hundred pounds.

But there is a fourth, and very cheap, way of getting software: and that is the computer magazines, of which there seems to be a huge selection. These programs are provided as listings which need to be typed into your computer and saved on to cassette for future use.

There are a number of pitfalls to be aware of when using magazines as a source of programs, not least of which is the question of which computer the programs are designed to work on. Sometimes this is actually stated; but in some magazines it is not and it is up to the reader to determine this for himself. This is by no means easy.

If the machine is not specified, a quick look through the listing may give a clue. Look for unfamiliar commands — if there are any that are not implemented on the Vic then I would forget it. Look for Vic-style graphics characters — although bear in mind that the PET and SHARP MZ80 have similar graphics. Look for familiar POKEs — if there are some unfamiliar POKEs then maybe they're not intended for the Vic (this requires a bit of experience to spot).

And if all else fails, you can always try typing it in and see if it works — or better still, ring the magazine and ask them. They'll get sick of being pestered and will soon learn to state which machine the programs are designed for. This also applies if the configuration of the Vic needed is not stated.

The next step is the laborious task of typing in the program. There is little doubt that even an elementary understanding of Basic will make entering the program very much easier because you will be typing something that is reasonably familiar.

Watch out for the difference between the number "1" and letter "I" or zero and the letter "O" — the zeros normally have a slash through them.

Be careful when typing numbers in the program — a mistype here could go unnoticed for a long time.

Colons and semicolon, fullstops and commas are easily confused — colons are only used to separate two statements in a line and will be followed by one of the Basic command words, while semicolons only appear in PRINT and some INPUT statements. Full stops never appear as part of a BASIC statement except as part of a decimal number, while commas occur in many Basic statements.

Finally, any combination of characters can appear within

quotes; and it is important that these are typed carefully, otherwise the resulting display could be very odd indeed. Take careful note, too, of the number of spaces or other repeated characters.

Typing these characters is probably the hardest task: it is often quite difficult to read the text and determine exactly what is meant. You will know that as soon as you type the first set of quotes pressing a cursor control key will not move the cursor but will produce an odd character on the screen. A second set of quotes cancels this and allows the cursor control keys to operate normally. This is designed to allow you to include cursor control codes within the strings of characters which will move the cursor according to these codes when printed.

When the program is subsequently listed, these codes appear as reverse field characters and are not very easy to follow. Some magazines turn these codes into self-explanatory messages; for instance <HOME> means the 'cursor home' key and <CUL> may mean the 'cursor left' key. Others simply print the listing as it comes off the printer and then it is important to be able to convert these reverse field characters into cursor control keys. The list of display codes on page 25 of the October edition of *Vic Computing* will certainly help here, but it doesn't take long to become familiar with these codes.

Although all characters appear on the listing as they appear on the screen, there is one exception: the pound sign. Although it will appear correctly on a listing from the Vic printer, the Pet printer doesn't have a pound sign and you will get a backslash (just like the "/" divide sign except the other way round).

Typing a long program can be a time-consuming business. I would suggest that you keep a tape in the cassette machine while typing and once in a while type SAVE. This means that you keep a copy of the program in case of mains failure or some other natural disaster. If you do this every 10 lines or so, and list the latest 10 lines on the screen, it will allow you to check your typing against the original while the backup is being made.

*T. Goldstone*

I would also suggest rewinding and VERIFYing the program periodically as I have heard of instances where corruption has occurred. After a long typing session, with intermediate versions SAVED, the final result was so corrupt that the whole program had to be typed again. The time lost in SAVEing and VERIFYing is small compared with the time taken to retype the whole listing.

Once you've typed the whole program and you have a verified copy on tape, you can type RUN and see what happens.

You'll more than likely get a SYNTAX ERROR or something similar. List that line and compare it with the original since there's probably a typing error.

If the error is other than a SYNTAX ERROR, the fault may be somewhere else — a DIVISION BY ZERO ERROR, for instance, could be due to be variable not being set correctly earlier in the program. Even if your understanding of Basic is very basic (sic) you should be able to track down most errors.

Sometimes you could be searching for a long time, though, and in this instance it may be better to check the whole program with the original print-out again — several people have found this easier if they can enlist the help of a friend who can watch the screen as you read out the history.

If you don't find an obvious typing error it is very easy to blame the magazine or the program author

for not debugging the program correctly. I have seen people give up very quickly with the comment that there must be a bug in program, but it's nearly always been their typing to blame.

That's not to say programs never appear without bugs. They do! But usually the errors are obvious and stupid — like lines of the program being omitted. Unfortunately there are occasions when a poorly-tested program does appear, and there's very little one can do about it.

If you are certain that you've typed the program in exactly as listed, and you can't find any bugs, don't hesitate to contact the magazine: it's more than likely that they are aware of the problem and have a solution.

If something disastrous happens during the running of the program, try to pin down the area most likely at fault. You can do this by inserting a STOP command in the middle of the program — if the fault occurs before the program aborts, try moving the STOP nearer to the start of the program. That way you may be able to isolate the section of program at fault and it is also a useful technique for debugging your own programs.

If it is the screen that goes haywire or the Vic crashes (that is, it appears to stop functioning) it could be that you've got a POKE value wrong. The numbers following a POKE or a PEEK must be correct and are probably worth a double check as their effects, if mistyped, can be very mystifying.

# BOSS

\*Requires 8K minimum.

# Routines

## Functions

Dr. Alan Grant of Victay in Malvern sent in this note showing how you can have up to 32 different function keys on the Vic. They are accessed by the four function keys in combination with the various shift keys. The shift keys give the following results in register 653:

No shift	0
SHIFT	1
COMMODORE	2
SHIFT + COMMODORE	3
CTRL	4
SHIFT + CTRL	5
COMMODORE + CTRL	6
SHIFT + COMM + CTRL	7

The function keys themselves produce the following results in register 203:

Top (f1)	39
Second (f3)	47
Third (f5)	55
Bottom (f7)	63

Try the following program:

```
10 S = PEEK(653):K = PEEK(203):
  IFK = 64 THEN 40
20 K = (1 + K)/8-4:PRINT"KEY"K
  + 4*S
30 GOTO 10
40 PRINT"NO KEY":GOTO 10
```

It is convenient to relabel the keys from top to bottom as KEY1 to KEY4.

The program then produces the results summarised in the following table:

	KEY1	KEY2	KEY3	KEY4
No shift	1	2	3	4
SHIFT	5	6	7	8
COMMODORE	9	10	11	12
SHIFT + COMMODORE	13	14	15	16
CTRL	17	18	19	20
SHIFT + CTRL	21	22	23	24
COMMODORE + CTRL	25	26	27	28
SHIFT + COMM + CTRL	29	30	31	32

Note that depressing the SHIFT and COMMODORE keys together will change the display to the alternate character ROM continuing the upper and lower case alphabet. Just press them again to return to the usual character set. Pressing the CTRL key will slow down program execution, and this shift key should be used only if the program is waiting for an input. ●

## Column print

When he bought a Vic printer, Vic Barton was rather taken back by the Heath Robertson way of printing columns. "The TAB command just produces rubbish, but I wanted to reduce it to the bare minimum. To make matters worse the columns are numbered 0-79."

```
10 DIM CH$(80)
20 FOR I=1 TO 80
30 IF I<11 THEN CH$(I)=CHR$(16)+"0"+RIGHT$(STR$(I-1),1):GOTO 50
40 CH$(I)=CHR$(16)+RIGHT$(STR$(I-1),2)
50 NEXT I
60 REM COLUMN NUMBER IS 'CN'
70 REM METHOD OF ACCESS IS- PRINT#4,CH$(CN);"STRING"
```

## Renumber

Everyone who writes programs occasionally needs to renumber lines — or at least ought to. Crowded programs are difficult to understand and soon become impossible to amend. Now, there are 'programmers' aid' add-ons from both Commodore and Stack that give you extra commands including RENUMBER: but until you can afford one of them, here's a neat little routine from A. R. Mulholland of Nottingham which will do at least part of the job.

```
0 INPUT LN,IN SE=4895
1 SE=SE+1 IF PEEK(PEEK(0) THEN 63001
63002 SE=SE+3 TV=INT(LN/256)
63003 POKESE,LN-TV*256 SE=SE+1 POKESE,TV
63004 LN=LN+IN GOTO 63001
```

Type in this lot with the program you want to renumber and RUN 63000 (though obviously the line numbers in the routine can be any you want, providing they come after the last line in the program you want renumbered).

In the code variable LN is line number; IN the increment; SE the 'searching for line number' variable; and TV the transient variable (used to save space).

When you run it, you will be asked for two numbers — the first is the line at which you want the renumbered program to start (usually 10), the second is the step between lines (go for 10 again). The program will then get going, stopping with an error message when it reaches itself. You then have to delete the renumbering routine; and you'll be left with the original program, unchanged but renumbered.

It doesn't change GOSUBs or GOTOs, though, so watch out for them — try marking their position in the original program with a REM, and then go back through the listing to change them manually.

This useful little program uses only 155 bytes: not bad at all. ●

# THE COMMODORE 64

## THE PERSONAL COMPUTER

**£299**  
PLUS VAT

- 64k built in RAM
- 40 column colour display—tv interface
- Upper and lower case characters and graphics
- Sprite graphics on eight levels
- Music synthesiser with three voices and nine octave range

Business and home utility programs available soon. Can use VIC-20 printer and disk (with rom upgrade). Supports other languages including Comal and Pascal—has CP/M option.

FOR PERSONAL AND BUSINESS  
COMPUTING THAT ALWAYS ADDS UP  
TO A GREAT DEAL MORE.

# We turn your VIC into a real computer for only

**£99.95**

**Computer World offers you its sensational videocartridge. Just plug it in, connect a video monitor with your VIC-20 and enter the world of professional computing. Discover word-processing, accounting etc.**

**Our new videocartridge has remarkable features for only £99.95**

- 40 or 80 column display (switchable from BASIC, without losing any program in memory);
- VIC and CBM/PET graphics;
- BY adding this board you can expand your VIC to 32K RAM, instead of 27.5K. (Note: you only need the expansion card with 3, 8 and 16K RAM cartridges).
- Upper and lower case characters with true decoders;
- Full cursor control;
- Program editing in 40 and 80 column mode;
- No alternations needed to your VIC;
- No external power supply needed;
- Fits in ARFON or Commodore expansion box;
- Now you can LOAD every Commodore or VIC program and adjust it to 40 or 80 columns;
- Operates with all ROM cartridges, except those working in the area A000 Hex to C000 Hex;

## Parallel Interface

A real pro printer for your VIC?  
Order our printer driver with cable!  
Please specify EPSON, OKI or BROTHER 8300 printer.

**£59.-**

## 64K RAM BOARD

Imagine your VIC-20 to be a 64K computer! Our board turns your dreams into reality... The 64K RAM unit fits directly into the back of any VIC or in an expansion box. When your VIC is switched, in it reports 27.5 Kbytes free. The upper RAM area consists of 6 blocks of 8K RAM each. The blocks can be switched by means of instruction POKE into the highest available 8K RAM area. This feature makes it possible to access a data area of 48K RAM. The 6 blocks can also be placed into the ROM area, so it will form a continuous 64K RAM area, which can be used to store e.g. very large machine language programs (compilers, assemblers, etc.)

**£99.-**

## Memory Expansion

If you want to expand your VIC with more memory you'll need this unique expander. Now you can have 7 more slots for programmers aid, RAM packs, etc. Computer World offers you this expander (with 1 slot completely tested) for £29.- (Add. £4.- for each extra connector).

**£29.-**

**Great news for HAM's... Now you can see what you hear!**

The TDK-20 'HAM interface' is a complete RTTY and MORSE code system for the VIC-20 computer. It comes in a single cartridge which you can plug in either a standard VIC-20 or in an expansion box. The cartridge includes two converters, one for MORSE reception and the other for RTTY. Just plug it in and you can read what's in the air on your VIC-monitor!

Features:

- RTTY transmit/receive;
- Audio input;
- 8 buffers to store text;
- LED tuning indicator;
- MORSE transmit/receive 6 Wpm tot 60 Wpm;
- Every Baudrate i.e. 45, 50, 57, 75, 110, 150, 200, 300 Baud;
- Every shift, 170, 225, 425, 850 Cs.;
- Old or New tones, 1275 or 2125 Cs.;
- WRU mode; CD ID; PTT

## VIC EPROM PROGRAMMER (2716/2732)

This EPROM programmer makes it possible for you to burn your own 4K EPROMS, so it won't be necessary anymore to load your programs into memory again, every time you had to switch of your VIC. This unit can be attached to any VIC, by just plugging the board into the expansion slot. A socket in which you can place your own EPROMS, is also available on the board!

# BEGINNERS

The other thing was that Andrew seemed to get the most kicks from the simplest reaction-time games rather than my more complicated Space Invader type games. Again, maybe he just needed more time to play about without father and uncle around to put him off. It will be a while yet before we know whether he shows signs of wanting a micro himself, though he played all evening and every evening.

I also had my old friend Freddie to stay and he too fell into the web. Now Freddie, champion archer and club chess player, is an ardent non-techno man — how I remember our old science lessons at school! It took me a good half-bottle of the best to lure him into Vic's lair.

But once Vic had won a couple of games of Rainbow Passage, and the Alien had run rings around him a few times, Freddie took the bait and set to in earnest. He picked up the LOAD, RUN, NEW and memory expansion procedures in a few minutes and settled down to a solid week's games-playing, finally deciding that VicGammon was the best challenge (one session lasted from breakfast through till nearly dawn the next day).

That was when I finally picked up the rules of the game. BugByte's Vic Gammon instructions only made sense to me after demonstration, but I had not really tried to figure it out properly before anyway. Now of course I'm hooked. I may be a

useless player but try telling me that at 3.30 in the morning!

I also withdraw my comments last time about VicGammon's graphics. They are quite adequate; and for a strategy game in only 6K of memory you can't really expect hi-res, can you?

I have to declare a preference for this type of game rather than the fast-reactions Space Invader style — though they can overlap of course. I do just love hi-res imagery! Can't win, can I? What I want I suppose is a Super-Adventure game (have to have 32K and disk I reckon) with wild hi-res shoot-outs combined with mind-bending strategy games all wrapped up in one grand design. Then I could lose every time!

Talking of 32K plus disk, would I have to expand my Vic up to full memory to be able to use a disk, or a printer? I haven't much use yet for a printer but I am beginning to find the delay on my cassette unit a bit irritating. I would like to be able to load, save and so on instantaneously.

Another question; as Commodore's disk and printer are so pricey (well I think so) what do you think of the alternatives? I speak of the el-cheapo Amber 2400 printer from Amber Controls Ltd. and the micro disk from our Little Red Brothers at BATS-NCI Ltd?

On a different tack, I wish there was some

way round the problem of those programs which cannot be cleared from memory without switching the whole thing off. Couldn't Commodore have got over this with some kind of overriding 'clear memory' key?

Another little problem someone might be able to offer a hint on, is with my Vic's acceptance of answers in a maths test program I am trying to amend. I wanted to limit the accuracy of answers for division problems to two or three decimal places, but could not see how.

The command INT(X) and LEFTS(X,X) seemed possible solutions at first (see how far my Basic has got) but I soon realised neither would do the job. I then discovered that if the answer to a division problem was taken to the eighth decimal place my Vic would not accept as correct a rounded-up answer — not even a rounded down one, nor yet an un-rounded one. It wouldn't even accept as correct the answer it had calculated for the same values (which was of course correctly rounded up). Why? I wish I had made a note of the values which gave this odd result, but I was so thoroughly confused by this time I gave up.

Have I discovered a Bugintherom? I'd like to have a bug named after me — not quite as romantic as a Luna Sea but it appeals to my warped sense of humour. Ah well, back to Basics.

The Durham modification in place — switchbank installed at the back of the Arfon pcb, epoxy-resin 'key' on top, and a cut in the printed circuit to socket 1 on the left.

Continued from page 15

There are times when you will want all combinations of memory from no additional RAM through an extra 3K up to a full 32K, depending on the program you wish to run. By switching in the relevant RAM cartridges before you turn on the main power you can set the Vic to run anything from a 3.5K machine code program up to a 32K 'Adventure' program, all without removing a single cartridge or having to run additional software.

One important final point to remember is not to switch any of the cartridges on or off while the main power is switched on. Not only might you damage a cartridge, but the Vic would not know that there had been any change and would therefore no longer function correctly.

epoxy glue

# Tommy's Tips

## Tommy on Piracy Protection — and more

Tommy is our resident technical expert. All the technical queries we get on the Vic are passed straight on to him, and nearly all of them will get a reply — usually in this column of the magazine rather than a personal missive, though you might just be lucky.

Dear Tommy, Can you give me a subroutine to be included as part of a program that will prevent that program from being SAVED on tape or disk unless those lines are specifically removed?

This might protect me and other hobbyists from pirates unless they are patient and clever enough to search through the listing to remove the instructions.

I am a newcomer to computing and very, very sleepy (too many late nights!). I also tend to mutter under my breath, gaze blankly into space and answer my wife with grunts. Is there a cure for this addiction to the hobby? If so don't tell me.

Can POS(X) and TAB(X) be used instead of cursor controls, and if so how?

I am afraid that it is impossible to protect your programs simply by adding a few lines to a program. There are several companies worldwide who sell protection software and hardware, but these are aimed mainly at software houses and tend to cost many hundreds of pounds. I have been involved in the microcomputer industry for pushing ten years now, and each time somebody produces a foolproof protection system somebody else produces a way to crack it. As Sherlock Holmes once said, "What one man can invent another can discover".

As regards the cure for your mental problems, I found that turning the hobby into a profession very quickly cured the addiction — but not the symptoms!

The POS(X) function basically tells you how many characters you have printed on the current line, which in my opinion is pretty useless because any programmer who doesn't know how many characters he has printed is not worth the title. My opinion is somewhat strengthened by the fact that I have never seen a professionally-produced program which used this function (but please don't write to tell me of any which do!).

There are two functions which you will find useful in PRINT statements, SPC(X) and TAB(X). SPC(X)

moves the cursor right X positions, and TAB(X) moves the cursor to column X.

I, and everyone else who doesn't use POS(X), will utilise TAB(X) and SPC(X) for laying out data on the screen, in columns for example. Unfortunately they are no replacement for the cursor up, down and left characters.

Dear Tommy, I have an expanded Vic and am experiencing problems. I wonder (hope) if you can help me. Does anybody produce a program which fools the Vic into thinking that it is unexpanded? If I continually remove my add-on RAM cartridge the contacts will wear. I am thus unable to access a wealth of software as it will not run in an expanded Vic. I have tried myself to alter the registers inside but with no success.

Try this little program:

```
10 DATA 169,0,141,129,2,
141,131,2
20 DATA 169,16,141,130,2,
169,30,141,132,2
30 DATA 141,136,2,32,24,229,
108,0,192
40 FOR I = 1 TO 27
50 READ A: POKE 8191 + I, A
60 NEXT
70 SYS 8192
```

Dear Tommy, I have recently bought a Vic-20 with a 24K expansion unit. In some high resolution graphics programs the top of memory pointer is moved using the statements POKE 51,255: POKE 52,19: POKE 55,255: POKE 56,19. On my machine this leaves me with only a little over 500 bytes of free memory (a tragic waste). The 6561 register is changed using the statements POKE 36869,253: POKE 36866, PEEK(36866) or 128. This instruction seems to send the computer into a state akin to catatonia.

Could you please tell me what I should do to lower the top of memory by some 2048 bytes to accommodate a set of user-defined graphics, whilst maintaining as much memory as possible, and what I need to do to

get the 6561 register to address the new graphics set. Trial and error have only resulted in the loss of large lumps of hair.

Let me start off with a warning. If anybody else writes to me boasting that they are "pulling their hair out" I will personally visit them to pull the rest out. Not everyone has hair to waste and I spend most of my time trying to glue mine back in!

Owing to the design of the 6561 chip which controls the screen on the Vic, together with the joysticks, paddles, and light pen, there are only a few usable positions in RAM for the character generator. As you have found out, the position used by an unexpanded Vic leaves only a few bytes of program space when applied to a machine with the 24K expansion added.

The solution is not to lower the top of memory, but to raise the bottom! How's that for lateral thinking? This subject, together with many more tips relating to graphics on the Vic is covered by Chris Preston in an article in the next edition of Vic Computing.

Dear Tommy, In the manual it says that the cassette recorder and the cassettes themselves should be kept away from the TV's magnetic field — the manual actually says six feet away. However in all the pictures I see of expansion systems etc. the TV and cassette recorder are side by side, indeed touching one another. How serious is this requirement?

I have been using the screen to design Fair Isle knitting patterns, but would like to use the Vic to work them out; how do you persuade the computer to divide one figure into another and tell you the remainder instead of dashing off into a string of unwanted decimal places?

Always glad to help a damsel in distress! The cassette recorder

should be as far away from the TV as is possible. Obviously a small portable TV has a weaker magnetic field than a 26in mammoth. The cassette should not really be touching the TV — certainly it should not sit on top of the set, adding heat to the magnetic effect — but two or three feet should be enough.

As for your second question, if you want to divide X by Y and find the remainder, use this expression:

$X - Y * \text{INT}(X/Y)$

By the way X should be greater than Y, otherwise the answer is just X.

Dear Tommy, If I randomly POKE 250 or 300 characters on to the screen, is there any way by which I can record each value as it is POKed? This is for a 'maze' game: I want to know if the player bumps into the maze wall. Has it got anything to do with DIM?

It has nothing to do with DIM, but I will explain anyway! When you POKE a character on to the screen, all you are doing is putting a value into a particular screen location. The Vic hardware reads the value in the location and displays the corresponding character on the screen. As the value is still in the memory location, you can always read it back with a PEEK.

In your case, what you need to do is this. Before the player moves you have to check the space into which he wants to move, to test if it is empty. Assuming the variable X contains the location of the player on the screen, you need to test:

F-22 ..... for a move UP  
F+1 ..... for a move RIGHT  
F+22 ..... for a move DOWN  
F-1 ..... for a move LEFT

# Dear Vic

Not having access to a Pet I experimented to find this way of inputting the TINYMON program into my Vic. You will need an expanded Vic and have to type the values in as DATA statements. Then add a basic loader (I used the one in Nick Hampshire's *Vic Revealed*) and append the following lines:

```
8000 OPEN 1,1,1, "PROGNAME"
9092 RS = "POKE":SS = ""
9094 PS = RS + STR$(L) + SS +
      STR$(N)
```

Amend lines:

```
9100 PRINT £1,PS
9140 CLOSE 1:END
```

The first data value will depend on how much memory you have — make it the start of Basic.

RUN the program and it saves a long file (it takes a few minutes). When finished rewind the tape and clear the memory, then type directly

```
POKE 43,1
POKE 44,4
POKE 45,20
POKE 46,8
POKE 47,24
POKE 48,8
POKE 49,24
POKE 50,8
```

After this use the 'merge' procedure to POKE 191,1: OPEN 1. When the Vic has found the file clear the screen, type three cursor downs, the then type:

```
PRINT "home" POKE 198,1 :
      POKE 813,13: POKE 153,1
```

When 'return' is pressed the Vic will be poking the values directly into their proper locations.

When finished type SAVE or RUN — the program will be in memory. G D Cossins, Leeds

I have had a Vic-20 for several months now, and wish to try my hand at machine code programming. After seeing the TINYMON 1 program in your April issue, I wonder if any of your readers might have a Pet suitable to load this TINYMON 1. If anyone can oblige, I live in the Bristol area and can be contacted after 6.30 pm on (0272) 852598.

Paul Knight, Bristol BS19 2AE

Can anyone oblige me by selling me a copy of TINYMON 1 as I do not have access to a Pet but would like to use this Machine Code monitor

D Fveson, 3 Tower Gardens, Westhill, Inverness

Rally round, folks. By the by, we've had a number of Victuals submissions that give you Jim Butterfield's TINYMON monitor via DATA statements on a Vic. We're deciding which is the best, and we'll publish it soon.

Incidentally, I am a Commodore 'Jelly Monsters' addict: how good is my best score of 124,830? And what's the yellow thing that appears after the pineapple? What's the blue thing after the purple dish?

Colleen Young, Croydon

**No idea. Any contributions?**

I regularly run programs on Vics and Pet, as I have a Vic at home and Pets at the school where I teach. Personally I have found Vic very good for educational programs though it does not seem to get much of a mention in this field. I have written a large number of programs (especially statistical and mathematical): is anyone interested?

It is interesting to see such a large number of articles in your magazine concerning Vic/Pet transfers. I think a careful distinction needs to be made between methods: POKE 4096,0; POKE 41,16; CLR etc is fine for listing and running, but if the program is saved on tape each time you load the program you still have to go through the POKE 4096,0... routine. If however you relocate the Vic program to the start of Pet's memory (see 'Vic into Pet won't go' in issue 2) and then save it, you have a program which can be run on Pet without further ado!

Incidentally, I am a Commodore 'Jelly Monsters' addict: how good is my best score of 124,830? And what's the yellow thing that appears after the pineapple? What's the blue thing after the purple dish?!

Colleen Young, Croydon

I have written the following short program to demonstrate a 'bug' I have found in my Vic:

```
10 PRINT "[CLR]": REM CLEAR SCREEN
20 POKE 36879,8: REM BLACK SCREEN
= * TI$ = "000000": REM SET CLOCK TO ZERO
40 IF VAL(TI$)<15 GOTO 40: REM LOOP UNTIL 15 SECONDS HAVE ELAPSED.
```

When this is run, a '@' character flickers in the top left hand corner of the screen. To overcome this fault, line 40 has to be changed to use TI instead of TI\$:

```
40 IF TI<(15*60) GOTO 40
```

I have also had difficulty when using the LOAD statement in a program to automatically load and run the next program on a tape. When I ran my first program with a LOAD statement in it, it appeared to load the next program (a game which uses the new characters) without any problems — until it started to RUN it. I was then faced with a syntax error message at the start of the program, although the program was error-free. The Vic crashed after I listed the line in error, which was full of rubbish!

Something I found useful, and may be of use to other Vic users, is the discovery that programs saved on tape can be re-recorded using audio tape recorders (I used a portable and hi-fi) and the copies can be loaded on the Vic with no problems. This method can be used on full tapes with several programs on each side, without the tedious task of saving and loading each time a copy of a tape is needed. This makes me wonder if the Vic cassette unit is really necessary for the Vic?

Lastly I would like to know if Commodore will be reviewing their prices of Vic-20 peripherals, which at the moment are beyond the budget of the average micro enthusiast? I am of course referring to the launch of the Spectrum and the 'Micro-Drive' soon to follow. How long will it take before someone markets an interface for the Vic and the Microdrive as has already been achieved for the Sinclair printer?

Michael Maxwell, Andover

...As for peripherals prices, elsewhere in this issue you'll find mention of a couple of low-cost Vic interfaces for the ZX printer; and like Michael we suspect it won't be long after the launch of the much-heralded but yet-to-be-seen Sinclair Microdrive before this 3.25in floppy disk unit can also be plugged into the Vic.

Sinclair is talking about £50 for the Microdrive, which certainly sounds impressive. But at least Commodore has just slashed the price of its own disk — which stores more, will probably provide faster access, and has no hassles over delivery or reliability. Not that we're suggesting the Microdrive will share the same kind of problems exhibited by some other Sinclair products...

With regards to the letter in your October 82 edition, I do not think you "got it wrong". Judging by the

time I had to wait to acquire a Super Expander cartridge and the demand at my local dealers, owners of the aforementioned cartridges are not in the minority.

I have been purchasing your excellent magazine from the onset and believe that you should be the leaders, as you were with the publication of the programs for the S.E. when you lead, other magazines follow. So keep up the good work.

Please publish other S.E. programs when available. You will find an eagerly awaiting public.

Kevin Hulston, Stockport.

This is one of many letters we've had congratulating us on the Super Expander programs. So expect a few more!

I have just purchased a Vic and there is one thing that puzzles me — in some places the maximum memory expansion is given as 32K bytes, in others it is 29K. Well, which is right?

James Murphy, Leeds

In fact the maximum memory range that can be addressed directly by an eight-bit microprocessor like the Vic's 6502 chip is 64K bytes, and we have heard that Someone Somewhere has indeed succeeded in running a Vic with 64KB (no, we don't know who or how). But Commodore's standard Vic-20 has a memory limitation of 32K bytes, a restriction that is imposed by the hardware design apparently to simplify things in there.

Now, you can add expansion memory to the 32KB limit. So where do all those remarks about the Vic running less than 32K come from? Well, on the full system some memory will be needed by the Vic itself: for programming in Basic you have a maximum of about 27,500 bytes available for your programs.

The other below-32K reference happens because some people ignore the 3.5KB you start with inside the Vic; so the maximum expansion memory is 28.5KB, often inflated to 29K for the purposes of writing advertisements.

Incidentally we're doing a quick round-up of all the expansion memory units we can find for our next issue. The range of prices is surprising!

Send us comments, queries and complaints: we'll answer everything we can and print anything that isn't boring or illegal. Address yourself to The Editor, Vic Computing, 39-41 North Road, London N7 9DP

This best seller was written by our Editor, Dr. Peter Holmes, and takes the learner through programming step by step using example after example in conjunction with the software tape that comes with the book. Assembly language allows far greater speed and lets you pack more program into the memory space available. Working through the programs that continuously develop your understanding of machine code you will also greatly expand your knowledge of the VIC 20 and how it operates.

The tape contains an assembler for the 3.5K VIC and an EXTENDED assembler for a 6.5K VIC including symbolic and memory labels, relocatable macros. FULL MACHINE CODE MONITOR features load/save onto/from tape, machine code edit functions/complete Binary/BCD/Hexadecimal tutor/and exerciser.

**£14<sup>95</sup>**

**YOU DO NOT NEED  
ANY KNOWLEDGE BEFORE  
YOU START**

## MINI 3 WAY EXPANDER

### MORE CARTRIDGES

**MINI EXPANDER** The Mini Expander is a high quality motherboard with three expansion sockets to accept your cartridges. The gold flashed edge connector plugs into the cartridge socket in your VIC 20\* and the board projects behind on its own rubber feet which allow it to rest firmly on the table. Full decode circuitry is on board and extra gating has been included to counteract any bus timing difficulty.

To be able to use three cartridges at the same time on your VIC 20\* will give you a fair degree of flexibility. You can have an 8K RAM cartridge and a 16K RAM cartridge. This plus the onboard 5K RAM will give you a 29K VIC 20\*. This still leaves you one socket free for games or High Res or Text Tool etc.

**£46<sup>95</sup>**  
INC VAT & POST

Socket for EPROM Expansion for firmware.

Sockets for 3K Extra Memory Expansion.

There are four empty sockets on your basic expansion unit. These allow you two additional expansion opportunities.

### MORE MEMORY

Instead of buying your 3K RAM memory expansion cartridge for £26.00 plus VAT you can now buy the memory chips to plug straight into your expansion board for £13.00 plus VAT. This will of course save you £13.00 which reduces your expansion board to £27.00 and still leaves you three sockets free.

### ROM EXPANSION

You also have available two sockets to take 2716 (2K EPROMS) which will allow you to have firmware permanently available to your system.

## SERIOUS VIC-20 PROGRAMS

### TOTL TEXT

**SIMPLY THE BEST:** Page numbering • Right and left margins • Skip to top of page • Centered title lines • Character and line spacing • Graphics characters • Full cursor control in editing • Add, change, delete characters • Specify printer device number • Print mailing labels • Paragraph control • VIC 1515 expanded characters • Single, double, triple spacing • Tab position control • Upper and/or lower case • Full screen editing • Scroll up and down through text • Insert, delete blocks of text • Multiple copies of document

Up to 4 heading lines per page • Footing line at bottom of page • Up to six 80 column lines may be entered and printed within the body of a document • Footnotes • Keyboard inputs

**£16.95**

### TOTL LABEL

A completely practical program for computerising address books or business mail lists. You define width, number of lines and number of characters. The program alphabetizes and you can assign account or customer numbers for further search control. You can print the whole list or selected labels. Make full use of your computer.

**£14.95**

### TOTL TIME

Easy to use, menu driven • Add, change, delete • Browse, (display on screen) • Inquiry display, (date range, Person, Project) • Save and load files on tape or disc • Use of full colour in screen display

Time report • 56 different bar chart report formats • Organise by Person, Project, activity • Sequence beginning or ending date or activity number • Four years, one year, six months, seven weeks, six 9 hour days, two 24 hours

**£16.95**

### RESEARCH ASSISTANT

It takes a competent programmer to write the program to create and control the necessary data files that will let you recall specific data at will. Here are three programs that will allow you to compile information from books, periodicals, accounts, dates in fact any data you wish to keep, to organise it and, most important of all, to create cross reference lists by keyword to help you locate the right reference when you need it.

**£16.95**

### BOUNCING GAMES

All the best of the machine ball games in one program. The programs take full advantage of the VICs colour capability and can be played through the keyboard, with paddles or joystick. Each game has four levels of difficulty. The games are: TENNIS, SQUASH, SOCCER, BREAK IN, ROLL ONE, ROLL TWO.
